23	Abstract:
24	This paper presents the nonlinear thermodynamic results of functionally graded plates
25	lying on Winkler/Pasternak and Kerr foundation through an analytical formulation. The field
26	displacement is defined by only four unknowns, including an indeterminate integral and a
27	new shape function representing the transverse shear stresses. Material properties of the FG
28	plates are temperature-dependent and graded according to a simple power-law distribution.
29	Also, the thermodynamic equations of motion are deduced based on Hamilton's principle.
30	The exactitude of the present theory results is verified with those obtained by various
31	researchers. The effects of temperature-dependence material properties, power-law index,
32	nonlinear temperature rising, elastic foundation parameters, aspect, and slenderness ratio are
33	discussed. The results show that the increase in elastic foundation parameters would enhance
34	the thermodynamic response of the FG plates. Nevertheless, the degree of improvement
35	would be related to the nonlinear temperature change. Moreover, the plate's configuration
36	effect is more significant when the nonlinear temperature difference is high.
37	Keywords: Nonlinear thermodynamic, FG plates, Winkler/Pasternak/Kerr foundation,

38 Temperature-dependence material.

40 **1. Introduction**

The continuous evolution of thermomechanical properties between the lower and upper surfaces of functionally graded structures makes them widely used in diverse areas such as aerospace, nuclear reactors, power sources, biomechanical, optical, civil, automotive, electronic, chemical, and mechanical engineering [1].

The material features gradually differ along with one or various dimensions of the 45 structure to achieve intended functionalities. Researchers developed FG materials to resist 46 47 ultra-high temperatures. The FG structures have been tested under high-temperature gradients across the cross-sectional thickness, Thai et al. [2]. This type of material is prepared by 48 mixing two different constituents, such as ceramic and metal. This advanced manufacturing 49 process aims at developing ideal heat-resistant materials. In this way, thermal resistance is 50 provided by a heat-resistant ceramic on one side. At the same time, crack resistance is offered 51 52 by metal with high thermal conductivity and high hardness. Thanks to these simultaneous functions, the use of (FGMs) has been fostered in thermal protection systems for melting 53 54 reactors and heat exchanger pipes [3-9].

After their innovation in the late 90s, researchers carried out various investigations to assess the thermomechanical and dynamic behaviors of FGMs plates using different analytical methods [10-14]. Thai et al. [2] confirmed that the FSDT is also accurate in investigating the free vibration analysis of FGM plates composed of functionally graded face sheets and an isotropic homogeneous core with variable thickness. Ye et al. [15] recently analyzed the free vibration behavior of FG sandwich plates using new higher-order refined models.

As stated previously, to withstand the high temperatures, FGM structures made up of 61 ceramic/metallic components are generally of interest. Shariyat [16] introduced a generalized 62 global-local theory to investigate the vibration behavior of FG sandwich plates exposed to 63 thermo-mechanical loads. Malekzadeh and Monajjemzadeh [17] investigated the thermal 64 dynamic response of FG plates resting on elastic foundation and subjected to a moving load 65 based on the first-order shear deformation theory, including the initial thermal stresses' 66 67 effects. Two dimensions' free vibration responses of temperature-dependent FG plates have been analyzed by Attia et al. [18] using four-variable higher-order shear deformation theory. 68 69 Parida and Mohanty [6] employed higher-order shear deformation theory (HSDT) to consider 70 the free vibration response of rotating functionally graded plates subjected to the nonlinear temperature. Zaoui et al. [19] studied the free vibration of FG temperature-dependent 71 72 properties plates using an improved exponential-trigonometric two-dimensional higher shear 73 deformation theory. Furthermore, Arshid et al. [20] analyzed the thermomechanical buckling

and vibrational behavior of a sandwich-curved microbeam resting on the visco-Pasternak 74 foundation. Navier's solution method is used to solve the differential equations system 75 analytically. Based on the findings, such intelligent structures can be used to design and 76 manufacture various equipment, making high stiffness-to-weight ratios more accessible. Li et 77 al. [21] investigated the nonlinear vibration behavior of FG sandwich beams. In thermal 78 environments, the beams have been modeled with an auxetic porous copper core. Singha et al. 79 [22] analyzed the vibration analysis of a rotating pre-twisted graphene-reinforced composite 80 81 (GRC) cylindrical shell. The temperature-dependent material properties of the FG-GRC have 82 been predicted by employing the continued Halpin-Tsai model. Abouelregal et al. [23] analyzed the vibrational behavior of rotating isotropic nanobeams using the nonlocal theory of 83 elasticity. This study aims to contribute to understanding the dynamics of rotating nanobeams 84 subject to varying heat sources. Also, the thermoelastic vibrations of nanobeams resting on a 85 86 Pasternak foundation and thermally loaded by ramp-type varying heat have been investigated 87 by Nasr et al. [24].

Nevertheless, limited research has been carried out to analyze the 3D thermodynamic 88 behavior of FG structures or those lying on Winkler, Pasternak, and Kerr foundation [25-27]. 89 Malekzadeh et al. [25] investigated the three-dimensional thermal dynamic response of thick 90 FG annular plates in a thermal environment. The differential quadrature method (DQM) has 91 been used to drive the 3D thermoelastic equilibrium equations. Tu et al. [27] have considered 92 the heat conduction and temperature-dependent material properties to analyze functionally 93 graded plates' 3D free vibration behavior in thermal environments using an eight-unknown 94 higher-order shear deformation theory. On the one hand, Parida and Mohanty [6] and Zaoui et 95 al. [28] are the only researchers investigating the nonlinear thermal vibration behavior of FG 96 plates based on a displacement field containing four variables (2D shear deformation theory). 97 98 On the other hand, the main advantage of our study is to use a displacement field containing the same number of unknowns (four variables) with 3D theory. Additionally, this model 99 simplifies the problem and considers the effect of transverse stretching, which is not 100 101 considered in the case of 2D- shear deformation theories.

According to this literature, in all the previously mentioned research, the thermal conductivity has always been considered independent of temperature, affecting the obtained results when the temperature difference is at high levels. Therefore, this work deals with proposing a new 3D modelling concept and investigating the nonlinear temperature field effect on the free vibration behavior of FG plates resting on various elastic foundations. Even more, the implications of temperature-dependent material properties, power-law property index, non-linear temperature rise, elastic foundation parameters, and aspect ratio andslenderness ratio are reviewed.

110 2. FG plates

111 The considered plates of length (*a*), width (*b*), and thickness (*h*) lie on elastic 112 foundations (Winkler-Pasternak foundation and Kerr foundation). All the investigated plates 113 are exposed to the nonlinear temperature change, see Figure 1. Mechanical characteristics 114 vary progressively with thickness, from the lower metal surface to the upper ceramic surface.

115 Significantly, to more accurately describe the behavior of FG plates at elevated 116 temperatures, the material parameters need to be temperature-dependent P(z,T), including 117 Poisson's ratio, Young's modulus, the thermal expansion, and the thermal conductivity are 118 presented as [29-30]:

119
$$P(z,T) = [P_c(T) - P_m(T)]V_c + P_m(T)$$
 (1)

120 $P_m(T)$ and $P_c(T)$ denote the effective temperature-dependent properties of the metal and 121 ceramic, respectively.

122 V_c denotes the ceramic fraction and it is given conforming to the power law:

123
$$V_c = \left(\frac{1}{2} + \frac{z}{h}\right)^k \tag{2a}$$

124 In which *k* is the volume fraction exponent.

Touloukian [31] suggests the material properties as follows:

126
$$P(T)_{i} = P_{0}(P_{-1}T^{-1} + 1 + P_{1}T + P_{2}T^{2} + P_{3}T^{3})$$
 (2b)

Where i = c, m. *T* is temperature in Kelvin, and P_j (j = -1, 1, 0, 1, 2, 3) are the temperaturedependent factors, see Table 1, Mamen [30]. Also, the variation of the effective temperaturedependent and independent material properties is illustrated in Figure 2.

Figures 2(a)-(c) show the evolution of temperature-dependent properties through the FG square plate's thickness. The temperature of the lower surface is constant ($T_m = 300K$), while the upper surface temperature is varied ($T_c = 300$ to 700K). It can find that the temperature has an important influence on all material properties except Poisson's coefficient. Therefore, in this investigation, Poisson's coefficient will be considered a constant (independent of temperature) and equals 0.28.

- 138
- 139

140 **3.** Nonlinear temperature distribution

Assume the FGM plates are exposed to nonlinear temperature rise (NLTR). The temperature field distributes nonlinearly from the upper surface T_c to the lower surface $T_m=300$ K. In this case, the one-dimensional steady-state heat conduction along the thickness is given as Salari et al. [32]:

145
$$-\frac{d}{dz}\left[\kappa(z,T)\frac{dT(z)}{dz}\right] = 0$$
(3)

146

Taking into account the continuous thermal conditions yields to:

147
$$T(z) = T_m + \Delta T \frac{\int_{-h/2}^{\infty} \frac{1}{\kappa(z,T)} dz}{\int_{-h/2}^{h/2} \frac{1}{\kappa(z,T)} dz}, \quad -\frac{h}{2} \le z \le \frac{h}{2}$$
(3a)

148 In which: $\Delta T = T_c - T_m$

Eq. (3a) can be solved by using an approximation of polynomial series expansion [33-35] and Mamen [30]:

151
$$T(z) = T_m + (T_c - T_m) \frac{D_1(z)}{D_0(z)}, \quad -\frac{h}{2} \le z \le \frac{h}{2}$$
 (3b)

152
$$D_j(z) = \sum_{i=0}^r \left(\frac{\kappa_m - \kappa_c}{\kappa_m}\right)^i \frac{\left(\frac{1}{2} + \frac{z}{h}\right)^{(in+1)j}}{in+1}, (j=0,1)$$
 (3c)

153 Where r represents the item numbers in the series and is chosen equals to five to ensure the 154 computation is accurate.

155 4. Theory and governing equations

156 4.1 Kinematics and constitutive relations

The boundary conditions are the main limitation of the present model compared to computational methods. In other words, the present model could be only used for simplysupported plates. However, with a slight modification in solutions (functions in the double Fourier series), the present model could effectively predict the behavior of clamped or simply-clamped FG plates.

Based on 2D and 3D higher shear deformation theories, the fields of displacement aredescribed as follows:

$$164 \qquad \begin{cases} u(x,y,z,t) = u_0(x,y,t) - z \ \frac{\partial w_0(x,y,t)}{\partial x} + K_1 f(z) \int \theta(x,y,t) dx \\ v(x,y,z,t) = v_0(x,y,t) - z \ \frac{\partial w_0(x,y,t)}{\partial y} + K_2 f(z) \int \theta(x,y,t) dy \\ w(x,z,t) = w_0(x,y,t) + ng(z) \theta(x,y,t) \end{cases}$$
(4)

The undetermined integral in Eq. (4) is simplified and declared as, Bouhadra [36]:

166
$$\int \theta(x, y, t) \, dx = A' \frac{\partial \theta(x, y, t)}{\partial x}$$
(5a)

167
$$\int \theta(x, y, t) \, dy = B' \frac{\partial \theta(x, y, t)}{\partial y}$$
(5b)

168 Based on Eqs. (5a-b), Eq. (4) takes the following form:

$$169 \quad \begin{cases} u(x,y,z,t) = u_0(x,y,t) - z \ \frac{\partial w_0(x,y,t)}{\partial x} + k_1 A' f(z) \frac{\partial \theta(x,y,t)}{\partial x} \\ v(x,y,z,t) = v_0(x,y,t) - z \ \frac{\partial w_0(x,y,t)}{\partial y} + k_2 B' f(z) \frac{\partial \theta(x,y,t)}{\partial y} \\ w(x,y,z,t) = w_0(x,y,t) + ng(z)\theta(x,y,t) \end{cases}$$
(6)

- 170 Where u_0, v_0, w_0 and θ are unknown displacements of the mid-plane of the FGM plate.
- 171 Where the coefficients (k_1, k_2) and (A', B') are defined as:

172
$$k_1 = -\lambda^2 \text{ and } A' = -\frac{1}{\lambda^2}$$
 (7a)

173
$$k_2 = -\beta^2 \text{ and } B' = -\frac{1}{\beta^2}$$
 (7b)

174 Note that λ and β are defined in Eq. (31).

175 f(z) represents the shape function defining the distribution of transverse shear deformation, it

is written as follows, Mamen [30]:

177
$$f(z) = z \left(\frac{27}{4} - 9z^2\right) \text{ and } g(z) = \frac{2}{15} \frac{df(z)}{dz}$$
 (8)

178 *n* is a real number and is given as follows:

179
$$\begin{cases} n=0 \text{ for } 2D\\ n=1 \text{ for Quasi-3D} \end{cases}$$
(9)

180 The deformations associated with displacements in Eq. (6) are:

181
$$\varepsilon_x = \frac{\partial u_0}{\partial x} - z \frac{\partial^2 w_0}{\partial x^2} + k_1 A' f(z) \frac{\partial^2 \theta}{\partial x^2}$$
(10a)

182
$$\varepsilon_{y} = \frac{\partial v_{0}}{\partial y} - z \frac{\partial^{2} w_{0}}{\partial y^{2}} + k_{2} B' f(z) \frac{\partial^{2} \theta}{\partial y^{2}}$$
(10b)

183
$$\varepsilon_z = g'(z)\theta$$
 (10c)

184
$$\gamma_{xz} = \frac{\partial \theta}{\partial x} \Big[k_1 A' f'(z) + g(z) \Big]$$
(10d)

185
$$\gamma_{yz} = \frac{\partial \theta}{\partial y} \Big[k_2 B' f'(z) + g(z) \Big]$$
(10e)

186
$$\gamma_{xy} = \frac{\partial u_0}{\partial y} - 2z \frac{\partial^2 w_0}{\partial x \partial y} + k_1 f(z) A' \frac{\partial^2 \theta}{\partial x \partial y} + \frac{\partial v_0}{\partial x} + k_2 f(z) B' \frac{\partial^2 \theta}{\partial x \partial y}$$
(10f)

187 Where $\varepsilon_x, \varepsilon_y$ and ε_z are the normal and the transverse strains, and $\gamma_{xz}, \gamma_{yz}, \gamma_{xy}$ are the transverse 188 shear strains.

Based on 3D displacement field expressed in Eq. (6), the linear constitutive relationsare given as:

$$191 \qquad \begin{cases} \sigma_{x} \\ \sigma_{y} \\ \sigma_{z} \\ \tau_{yz} \\ \tau_{xz} \\ \tau_{xy} \end{cases} = \begin{bmatrix} C_{11} & C_{12} & C_{13} & 0 & 0 & 0 \\ C_{12} & C_{22} & C_{23} & 0 & 0 & 0 \\ C_{13} & C_{23} & C_{33} & 0 & 0 & 0 \\ 0 & 0 & 0 & C_{44} & 0 & 0 \\ 0 & 0 & 0 & 0 & C_{55} & 0 \\ 0 & 0 & 0 & 0 & 0 & C_{56} \end{bmatrix} \begin{bmatrix} \varepsilon_{x} \\ \varepsilon_{y} \\ \varepsilon_{z} \\ \gamma_{yz} \\ \gamma_{xz} \\ \gamma_{xy} \end{bmatrix}$$
(11)

192 The effective temperature-dependent elastic constants $C_{ij}(z,T)$ depending on the normal strain

193 \mathcal{E}_z are given as follows:

• Case of 2D (
$$\varepsilon_z = 0$$
), then C_{ij} are:

$$C_{11} = C_{22} = \frac{E(z,T)}{1 - v(z,T)^2}$$
195
$$C_{12} = \frac{v(z,T) E(z,T)}{1 - v(z,T)^2}$$

$$C_{44} = C_{55} = C_{66} = \frac{E(z,T)}{2[1 + v(z,T)]}$$
(12a)

• Case of quasi-3D ($\varepsilon_z \neq 0$), then C_{ij} are:

$$C_{11} = C_{22} = C_{33} = \frac{E(z,T) [1 - v(z,T)]}{[1 - 2v(z,T)] [1 + v(z,T)]}$$
197
$$C_{12} = C_{13} = C_{23} = \frac{v(z,T) E(z,T)}{[1 - 2v(z,T)] [1 + v(z,T)]}$$

$$C_{44} = C_{55} = C_{66} = \frac{E(z,T)}{2[1 + v(z,T)]}$$
(12b)

198 **4.2** Governing equations of motion

By employing the Hamilton principle in its analytical form, the three governing equations are developed as follows, Esmaeilzadeh and Kadkhodayan [37]; Mamen [30]:

201
$$\int_{t_1}^{t_2} \delta(U + P_f + V - K) dt = 0$$
(13)

202 In which t_1 and t_2 are the initial and end times, respectively.

203 The change of the total strain energy is represented as, Li et al. [38]:

204
$$\delta U = \int_{V} \sigma_{ij} \delta \varepsilon_{ij} \, dV$$

205 (14)

206
$$\delta U = \int_{-h/2}^{+h/2} \int_{0}^{a} \int_{0}^{b} \left(\sigma_{x} \delta \varepsilon_{x} + \sigma_{y} \delta \varepsilon_{y} + \sigma_{z} \delta \varepsilon_{z} + \tau_{xz} \delta \gamma_{xz} + \tau_{yz} \delta \gamma_{yz} + \tau_{xy} \delta \gamma_{xy} \right) dz \, dx \, dy \tag{15}$$

$$207 \qquad \delta U = \int_{0}^{a} \int_{0}^{b} \left[N_{x} \frac{\partial \delta u_{0}}{\partial x} - M_{x}^{b} \frac{\partial^{2} \delta w_{0}}{\partial x^{2}} + k_{1} A' M_{x}^{s} \frac{\partial^{2} \delta \theta}{\partial x^{2}} + k_{2} B' M_{y}^{s} \frac{\partial^{2} \delta \theta}{\partial y^{2}} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{1} A' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy}^{s} \frac{\partial^{2} \delta \theta}{\partial x \partial y} + k_{2} B' M_{xy$$

208 Where *N*, *M*, *S* and *Q* are the force and moment components represented in the following 209 forms, Mamen [30]:

210
$$\left(N_{i}, M_{i}^{b}, M_{i}^{s}\right) = \int_{-h/2}^{+h/2} (1, z, f(z)) \sigma_{i} dz, (i = x, y, xy)$$
 (17a)

211
$$N_z = \int_{-h/2}^{+h/2} \sigma_z dz$$
 (17b)

212
$$\left(S_{xz}^{s}, S_{yz}^{s}\right) = \int_{-h/2}^{+h/2} (\tau_{xz}, \tau_{yz}) g(z) dz$$
 (17c)

213
$$\left(Q_{xz}^{s}, Q_{yz}^{s}\right) = \int_{-h/2}^{+h/2} \left(\tau_{xz}, \tau_{yz}\right) f'(z) dz$$
 (17d)

- Using Equations (10), (11) and (12b), *N*, *M*, *S* and *Q* can be represented, see Appendix
- 215 A (Eq.A.1).
- 216 The effective temperature-dependent stiffness elements are stated as follows:

217
$$\begin{cases} A_{11} \quad B_{11} \quad D_{11} \quad B_{11}^{s} \quad D_{11}^{s} \quad H_{11}^{s} \\ A_{12} \quad B_{12} \quad D_{12} \quad B_{12}^{s} \quad D_{12}^{s} \quad H_{12}^{s} \\ A_{66} \quad B_{66} \quad D_{66} \quad B_{66}^{s} \quad D_{66}^{s} \quad H_{66}^{s} \end{cases} = \int_{-h/2}^{h/2} \left[1, z, z^{2}, f(z), zf(z), f^{2}(z) \right] \begin{cases} C_{11}(z,T) \\ C_{12}(z,T) \\ C_{66}(z,T) \end{cases} dz$$
(18)

218
$$(A_{22}, B_{22}, D_{22}, B_{22}^s, D_{22}^s, H_{22}^s) = (A_{11}, B_{11}, D_{11}, B_{11}^s, D_{11}^s, H_{11}^s)$$
 (19a)

219
$$\begin{cases} L \\ L^{a} \\ R \end{cases} = \int_{-h/2}^{h/2} C_{ij}(z,T) \begin{cases} 1 \\ z \\ f(z) \end{cases} g'(z) dz, \{R^{a}\} = \int_{-h/2}^{h/2} C_{33}(z,T) [g'(z)]^{2} dz \text{ and } (i = 1, 2; j = 3)$$
(19b)

220
$$F_{44}^{s} = F_{55}^{s} = \int_{-h/2}^{h/2} C_{ii}(z,T) [f'(z)]^{2} dz$$
 and $(i = 4, 5)$ (19c)

221
$$X_{44}^{s} = X_{55}^{s} = \int_{-h/2}^{h/2} C_{ii}(z,T) f(z) g(z) dz$$
 and $(i = 4, 5)$ (19d)

222
$$A_{44}^{s} = A_{55}^{s} = \int_{-h/2}^{h/2} C_{ii}(z,T) [g(z)]^{2} dz$$
 and $(i = 4, 5)$ (19e)

223 The variation of the potential energy of foundations is given by:

224
$$\delta P_f = \int_0^a \int_0^b (f_e + f_{Kerr}) \delta w_0 \, dx \, dy \tag{20}$$

225 Where f_e and f_{Kerr} are the densities of reaction forces for the Pasternak foundation and Keer 226 foundation model, respectively.

Importantly, the Pasternak foundation is a two-parameter elastic model and its distributedreaction force is expressed as:

229
$$f_e = K_w w_0 - K_p \left(\frac{\partial^2 w_0}{\partial x^2} + \frac{\partial^2 w_0}{\partial y^2} \right)$$
(20a)

In which
$$K_w$$
 and K_p are the Winkler and the shear layer coefficients of the elastic foundation,
respectively.

232 More importantly, the Kerr model foundation is a three-parameter elastic model, and its233 distributed reaction force is expressed as:

234
$$f_{Kerr} = \left(\frac{K_l K_u}{K_l + K_u}\right) w_0 - \left(\frac{K_s K_u}{K_l + K_u}\right) \left(\frac{\partial^2 w_0}{\partial x^2} + \frac{\partial^2 w_0}{\partial y^2}\right)$$
(20b)

In which K_s is the shear layer parameter, K_u is the upper elastic layer, and K_l is the lower elastic layer. The kinetic energy variation is represented as, Mamen [30]:

$$238 \qquad \delta K = \int_{0}^{a} \int_{0}^{b+h/2} \rho(z) (\dot{u}_{0} \,\delta \dot{u}_{0} + \dot{v}_{0} \,\delta \dot{v}_{0} + \dot{w}_{0} \,\delta \dot{w}_{0}) dx dy dz \qquad (21)$$

$$= \int_{0}^{a} \int_{0}^{b-h/2} \rho(z) (\dot{u}_{0} \,\delta \dot{u}_{0} + \dot{v}_{0} \,\delta \dot{v}_{0} + \dot{w}_{0} \,\delta \dot{w}_{0}) dx dy dz \qquad (21)$$

$$= \int_{0}^{a} \int_{0}^{b} \left[I_{0} (\dot{u}_{0} \,\delta \dot{u}_{0} + \dot{v}_{0} \,\delta \dot{v}_{0} + \dot{w}_{0} \,\delta \dot{w}_{0}) - I_{1} \left(\dot{u}_{0} \,\frac{\partial \delta \dot{w}_{0}}{\partial x} + \frac{\partial \dot{w}_{0}}{\partial x} \,\delta \dot{u}_{0} + \dot{v}_{0} \,\frac{\partial \delta \dot{w}_{0}}{\partial y} + \frac{\partial \dot{w}_{0}}{\partial y} \,\delta \dot{v}_{0} \right) \right] dx dy \qquad (21a)$$

$$= \int_{0}^{a} \int_{0}^{b} \left[+J_{1} \left(k_{1}A' \dot{u}_{0} \,\frac{\partial \delta \dot{\theta}}{\partial x} + k_{1}A' \frac{\partial \dot{\theta}}{\partial x} \,\delta \dot{u}_{0} + k_{2}B' \dot{v}_{0} \,\frac{\partial \delta \dot{\theta}}{\partial y} + k_{2}B' \frac{\partial \dot{\theta}}{\partial y} \,\delta \dot{v}_{0} \right) \right] dx dy \qquad (21a)$$

$$= \int_{0}^{2} \left(k_{1}A' \frac{\partial \dot{w}_{0}}{\partial x} \,\frac{\partial \delta \dot{\theta}}{\partial x} + k_{1}A' \frac{\partial \dot{\theta}}{\partial x} \,\frac{\partial \delta \dot{w}_{0}}{\partial x} + k_{2}B' \frac{\partial \dot{w}_{0}}{\partial y} \,\frac{\partial \delta \dot{\theta}}{\partial y} + k_{2}B' \frac{\partial \dot{\theta}}{\partial y} \,\delta \dot{v}_{0} \right) + K_{2} \left[(k_{1}A')^{2} \,\frac{\partial \dot{\theta}}{\partial x} \,\frac{\partial \delta \dot{\theta}}{\partial x} + (k_{2}B')^{2} \,\frac{\partial \dot{\theta}}{\partial y} \,\frac{\partial \delta \dot{\theta}}{\partial y} \right] + J_{0} \left(\dot{w}_{0} \delta \dot{\theta} + \dot{\theta} \delta \dot{w}_{0} \right) + K_{0} \dot{\theta} \delta \dot{\theta}$$

237

The dot–superscript convention is used to denote the time derivative.

241 $I_0, I_1, I_2, J_1, J_2, K_2, J_0$ and K_0 are the independent-temperature mass inertias.

242
$$[I_0, I_1, I_2, J_1, J_2, K_2, J_0, K_0] = \int_{-h/2}^{+h/2} \rho(z) [1, z, z^2, f(z), zf(z), f^2(z), g(z), ^2(z)] dz$$
 (21b)

243 The variation of work done by thermal loads is written in the following form:

244
$$\delta V = \int_{0}^{a} \int_{0}^{b} \left(N_{x}^{T} \frac{\partial^{2} w}{\partial x^{2}} + 2N_{xy}^{T} \frac{\partial^{2} w}{\partial x \partial y} + N_{y}^{T} \frac{\partial^{2} w}{\partial y^{2}} \right) \delta w \, dx \, dy$$
(22)

245 Where N_x^T , N_y^T and N_{xy}^T are defined as follows:

246
$$N_x^T = \int_{-h/2}^{+h/2} C_{11}(z,T) \alpha(z,T) (T(z) - T_0) dz$$
(23-a)

247
$$N_{y}^{T} = \int_{-h/2}^{+h/2} C_{22}(z,T) \alpha(z,T) (T(z) - T_{0}) dz$$
(23-b)

248
$$N_{xy}^{T} = \int_{-h/2}^{+h/2} C_{12}(z,T) \alpha(z,T) (T(z) - T_0) dz$$
(23-c)

249 As $C_{11} = C_{22}$, we get $N_x^T = N_y^T = N^T$

250 The variation of work done by thermal loads becomes as follows:

251
$$\delta V = \int_{0}^{a} \int_{0}^{b} \left(N^{T} \left(\frac{\partial^{2} w}{\partial x^{2}} + \frac{\partial^{2} w}{\partial y^{2}} \right) + 2N_{xy}^{T} \frac{\partial^{2} w}{\partial x \partial y} \right) \delta w \, dx \, dy$$
(24)

where T(z) is the nonlinear field of temperature (see Eqs. 3a-c), and the initial temperature T_0 = 300*K*.

Substituting Eqs. (16), (20), (21a) and (24) into Eq. (13), the equations of motion are obtained in the following forms:

256
$$\delta u_0: \frac{\partial N_x}{\partial x} + \frac{\partial N_{xy}}{\partial y} = I_0 \ddot{u}_0 - I_1 \frac{\partial \ddot{w}_0}{\partial x} + J_1 k_1 A' \frac{\partial \ddot{\theta}}{\partial x}$$
(25a)

257
$$\delta v_0: \frac{\partial N_y}{\partial y} + \frac{\partial N_{xy}}{\partial x} = I_0 \ddot{v}_0 - I_1 \frac{\partial \ddot{w}_0}{\partial y} + J_1 k_2 B' \frac{\partial \ddot{\theta}}{\partial y}$$
(25b)

$$\delta w_{0} : \frac{\partial^{2} M_{x}^{b}}{\partial x^{2}} + \frac{\partial^{2} M_{y}^{b}}{\partial y^{2}} + 2 \frac{\partial^{2} M_{xy}^{b}}{\partial x \partial y} - \left(f_{e} + f_{Kerr}\right) + N^{T} \left(\frac{\partial^{2} w_{0}}{\partial x^{2}} + \frac{\partial^{2} w_{0}}{\partial y^{2}}\right) + N^{T} g\left(0\right) \left(\frac{\partial^{2} \theta}{\partial x^{2}} + \frac{\partial^{2} \theta}{\partial y^{2}}\right) = I_{0} \ddot{w}_{0} + I_{1} \left(\frac{\partial \ddot{u}_{0}}{\partial x} + \frac{\partial \ddot{v}_{0}}{\partial y}\right) \\ - I_{2} \left(\frac{\partial^{2} \ddot{w}_{0}}{\partial x^{2}} + \frac{\partial^{2} \ddot{w}_{0}}{\partial y^{2}}\right) + J_{2} \left(k_{1} A' \frac{\partial^{2} \ddot{\theta}}{\partial x^{2}} + k_{2} B' \frac{\partial^{2} \ddot{\theta}}{\partial y^{2}}\right) + J_{0} \ddot{\theta}$$
259 (25c)

$$\delta\theta: -k_{1}A'\frac{\partial^{2}M_{x}^{s}}{\partial x^{2}} - k_{2}B'\frac{\partial^{2}M_{y}^{s}}{\partial y^{2}} - N_{z} + (k_{1}A' + k_{2}B')\frac{\partial^{2}M_{xy}^{s}}{\partial x\partial y} + k_{1}A'\frac{\partial Q_{xz}^{s}}{\partial x} + k_{2}B'\frac{\partial Q_{yz}^{s}}{\partial y} + \frac{\partial S_{xz}^{s}}{\partial x} + \frac{\partial S_{yz}^{s}}{\partial y}$$

$$= +N^{T}g\left(0\right)\left(\frac{\partial^{2}w_{0}}{\partial x^{2}} + \frac{\partial^{2}w_{0}}{\partial y^{2}}\right) + N^{T}g\left(0\right)^{2}\left(\frac{\partial^{2}\theta}{\partial x^{2}} + \frac{\partial^{2}\theta}{\partial y^{2}}\right) + 2N_{xy}^{T}g\left(0\right)\left(\frac{\partial^{2}w_{0}}{\partial x\partial y}\right) + N^{T}g\left(0\right)^{2}\left(\frac{\partial^{2}\theta}{\partial x\partial y}\right) = -J_{1}\left(k_{1}A'\frac{\partial\ddot{u}_{0}}{\partial x} + k_{2}B'\frac{\partial\ddot{v}_{0}}{\partial y}\right) + J_{2}\left(k_{1}A'\frac{\partial^{2}\ddot{w}_{0}}{\partial x^{2}} + k_{2}B'\frac{\partial^{2}\ddot{w}_{0}}{\partial y^{2}}\right) - K_{2}\left[\left(k_{1}A'\right)^{2}\frac{\partial^{2}\ddot{\theta}}{\partial x^{2}} + \left(k_{2}B'\right)^{2}\frac{\partial^{2}\ddot{\theta}}{\partial y^{2}}\right] + J_{0}\ddot{w}_{0} + K_{0}\ddot{\theta}$$

$$= 261$$

Eqs. (25a), (25b), (25c) and (25d) can be expressed in terms of u_0, v_0, w_0 and θ by using Eq. (18) as follows:

(25d)

$$\delta u_{0} : A_{11} \frac{\partial^{2} u_{0}}{\partial x^{2}} + A_{66} \frac{\partial^{2} u_{0}}{\partial y^{2}} + (A_{12} + A_{66}) \frac{\partial^{2} v_{0}}{\partial x \partial y} - B_{11} \frac{\partial^{3} w_{0}}{\partial x^{3}} - (B_{12} + 2B_{66}) \frac{\partial^{3} w_{0}}{\partial x \partial y^{2}} + \left[B_{12}^{s} k_{2} B' + B_{66}^{s} \left(k_{1} A' + k_{2} B' \right) \right] \frac{\partial^{3} \theta}{\partial x \partial y^{2}} + B_{11}^{s} k_{1} A' \frac{\partial^{3} \theta}{\partial x^{3}} + L \frac{\partial \theta}{\partial x} = I_{0} \ddot{u}_{0} - I_{1} \frac{\partial \ddot{w}_{0}}{\partial x} + J_{1} k_{1} A' \frac{\partial \ddot{\theta}}{\partial x}$$

$$(26a)$$

$$\delta v_{0} : \left(A_{12} + A_{66}\right) \frac{\partial^{2} u_{0}}{\partial x \partial y} + A_{22} \frac{\partial^{2} v_{0}}{\partial y^{2}} + A_{66} \frac{\partial^{2} v_{0}}{\partial x^{2}} - B_{22} \frac{\partial^{3} w_{0}}{\partial y^{3}} - \left(B_{12} + 2B_{66}\right) \frac{\partial^{3} w_{0}}{\partial x^{2} \partial y} + \left[B_{12}^{s} k_{1} A' + B_{66}^{s} \left(k_{1} A' + k_{2} B'\right)\right] \frac{\partial^{3} \theta}{\partial x^{2} \partial y} + B_{22}^{s} k_{2} B' \frac{\partial^{3} \theta}{\partial y^{3}} + L \frac{\partial \theta}{\partial y} = I_{0} \ddot{v}_{0} - I_{1} \frac{\partial \ddot{w}_{0}}{\partial y} + J_{1} k_{2} B' \frac{\partial \ddot{\theta}}{\partial y}$$
(26b)

$$\begin{split} \delta w_{0} &: B_{11} \frac{\partial^{3} u_{0}}{\partial x^{3}} + \left(B_{12} + 2B_{66}\right) \frac{\partial^{3} u_{0}}{\partial x \partial y^{2}} + \left(B_{12} + 2B_{66}\right) \frac{\partial^{3} v_{0}}{\partial x^{2} \partial y} + B_{22} \frac{\partial^{3} v_{0}}{\partial y^{3}} + 2\left(D_{12} + 2D_{66}\right) \frac{\partial^{4} w_{0}}{\partial x^{2} \partial y^{2}} \\ &- D_{22} \frac{\partial^{4} w_{0}}{\partial y^{4}} - D_{11} \frac{\partial^{4} w_{0}}{\partial x^{4}} + D_{11}^{s} k_{1} A^{'} \frac{\partial^{4} \theta}{\partial x^{4}} - \left[\left(D_{12}^{s} + 2D_{66}^{s}\right)\left(k_{1} A^{'} + k_{2} B^{'}\right)\right] \frac{\partial^{4} \theta}{\partial x^{2} \partial y^{2}} \\ &+ D_{22}^{s} k_{2} B^{'} \frac{\partial^{4} \theta}{\partial y^{4}} + L_{a} \left(\frac{\partial^{2} \theta}{\partial x^{2}} + \frac{\partial^{2} \theta}{\partial y^{2}}\right) - K_{w} w_{0} + K_{p} \left(\frac{\partial^{2} w_{0}}{\partial x^{2}} + \frac{\partial^{2} w_{0}}{\partial y^{2}}\right) - \left(\frac{K_{I} K_{u}}{K_{I} + K_{u}} w_{0}\right) \\ &+ \left(\frac{K_{s} K_{u}}{K_{I} + K_{u}}\right) \left(\frac{\partial^{2} w_{0}}{\partial x^{2}} + \frac{\partial^{2} w_{0}}{\partial y^{2}}\right) + N^{T} \left(\frac{\partial^{2} w_{0}}{\partial x^{2}} + \frac{\partial^{2} w_{0}}{\partial y^{2}}\right) + N^{T} g\left(0\right) \left(\frac{\partial^{2} \theta}{\partial x^{2}} + \frac{\partial^{2} \theta}{\partial y^{2}}\right) \\ &+ 2N_{xy}^{T} \left(\frac{\partial^{2} w_{0}}{\partial x \partial y}\right) + 2N_{xy}^{T} g\left(0\right) \left(\frac{\partial^{2} \theta}{\partial x \partial y}\right) = I_{0} \ddot{w}_{0} + I_{1} \left(\frac{\partial \ddot{u}_{0}}{\partial x} + \frac{\partial \ddot{v}_{0}}{\partial y}\right) - I_{2} \left(\frac{\partial^{2} \ddot{w}_{0}}{\partial x^{2}} + \frac{\partial^{2} \ddot{w}_{0}}{\partial y^{2}}\right) \\ &+ J_{2} \left(k_{1} A^{'} \frac{\partial^{2} \ddot{\theta}}{\partial x^{2}} + k_{2} B^{'} \frac{\partial^{2} \ddot{\theta}}{\partial y^{2}}\right) + J_{0} \ddot{\theta} \end{split}$$

(26c)

(26d)

272

273

274 **4.3** Analytical solutions for FGM plate

We are interested here in finding exact solutions for the free vibration problem of simply-supported FG plate. With the Navier solution technique, the change in displacement can be calculated as follows:

278
$$u_0(x, y, t) = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} u_{mn} \cos(\lambda x) \sin(\beta y) e^{i\omega_n t}$$
(27)

279
$$v_0(x, y, t) = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} v_{mn} \sin(\lambda x) \cos(\beta y) e^{i\omega_n t}$$
(28)

280
$$w_0(x, y, t) = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} w_{mn} \sin(\lambda x) \sin(\beta y) e^{i\omega_n t}$$
(29)

281
$$\theta(x, y, t) = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \theta_{mn} \sin(\lambda x) \sin(\beta y) e^{i\omega_n t}$$
(30)

282 With:
$$\lambda = \frac{m\pi}{a}$$
 and $\beta = \frac{n\pi}{b}$ (31)

In which $(u_{mn}, v_{mn}, w_{mn}, \theta_{mn})$ are unknown parameters to be determined. The boundary conditions are represented as:

285

$$v_{0} = w_{0} = \theta = \frac{\partial \theta}{\partial y} = N_{x} = M_{x}^{b} = M_{x}^{s} = 0 \text{ at } x = 0, a$$

$$u_{0} = w_{0} = \theta = \frac{\partial \theta}{\partial x} = N_{y} = M_{y}^{b} = M_{y}^{s} = 0 \text{ at } y = 0, b$$
(32)

Substituting 27, 28, 29 and 30 into 26a, 26b, 26c and 26d, respectively, leads to:

287
$$\begin{bmatrix} -A_{11}\lambda^{2} - A_{66}\beta^{2} - I_{0}\omega_{n}^{2} \end{bmatrix} u_{mn} + \begin{bmatrix} -(A_{11} + A_{66})\lambda\beta \end{bmatrix} v_{mn} + \begin{bmatrix} B_{11}\lambda^{3} + (B_{12} + 2B_{66})\lambda\beta^{2} + I_{1}\omega_{n}^{2}\lambda \end{bmatrix} w_{mn} + \begin{bmatrix} -k_{1}A'J_{1}\lambda\omega_{n}^{2} - (B_{12}^{s}k_{2}B' + B_{66}^{s}(k_{1}A' + k_{2}B'))\lambda\beta^{2} - B_{11}^{s}k_{1}A'\lambda^{3} + L\lambda \end{bmatrix} \theta_{mn} = 0$$
288 (33a)

289
$$\begin{bmatrix} -(A_{12} + A_{66})\lambda\beta \end{bmatrix} u_{mn} + \begin{bmatrix} -A_{22}\beta^2 - A_{66}\lambda^2 - I_0\omega_n^2 \end{bmatrix} v_{mn} + \begin{bmatrix} I_1\omega_n^2\beta + B_{22}\beta^3 + (B_{12} + 2B_{66})\lambda^2\beta \end{bmatrix} w_{mn} + \begin{bmatrix} -k_2B'J_1\beta\omega_n^2 - (B_{12}^sk_1A' + B_{66}^s(k_1A' + k_2B'))\beta\lambda^2 - B_{22}^sk_2B'\beta^3 + L\beta \end{bmatrix} \theta_{mn} = 0$$
290 (33b)

$$\begin{bmatrix} I_{1}\omega_{n}^{2}\lambda + B_{11}\lambda^{3} + (B_{12} + 2B_{66})\lambda\beta^{2} \end{bmatrix}u_{mn} + \begin{bmatrix} I_{1}\omega_{n}^{2}\beta + B_{22}\beta^{3} + (B_{12} + 2B_{66})\lambda^{2}\beta \end{bmatrix}v_{mn} \\ + \begin{bmatrix} -\omega_{n}^{2}(I_{0} + I_{2}(\lambda^{2} + \beta^{2})) - 2(D_{12} + 2D_{66})\lambda^{2}\beta^{2} - D_{22}\beta^{4} - D_{11}\lambda^{4} \\ -K_{w} - K_{p}(\lambda^{2} + \beta^{2}) - (\frac{K_{1}K_{u}}{K_{1} + K_{u}}) - (\frac{K_{s}K_{u}}{K_{l} + K_{u}})(\lambda^{2} + \beta^{2}) + N^{T}(\lambda^{2} + \beta^{2}) - 2N_{xy}^{T}(\lambda\beta) \end{bmatrix}^{W_{mn}} \\ + \begin{bmatrix} -\omega_{n}^{2}(-J_{2}(k_{1}A'\lambda^{2} + k_{2}B'\beta^{2}) + J_{0}) + D_{11}^{s}k_{1}A'\lambda^{4} + (D_{12}^{s} + 2D_{66}^{s})(k_{1}A' + k_{2}B')\lambda^{2}\beta^{2} \\ + D_{22}^{s}k_{2}B'\beta^{4} - L_{a}(\lambda^{2} + \beta^{2}) + N^{T}g(0)(\lambda^{2} + \beta^{2}) - 2N_{xy}^{T}g(0)(\lambda\beta) \end{bmatrix} \theta_{mn} = 0 \end{aligned}$$
292
(33c)

$$\begin{bmatrix} -k_{1}A'J_{1}\lambda\omega_{n}^{2} - (B_{12}^{s}k_{2}B' + B_{66}^{s}(k_{1}A' + k_{2}B'))\lambda\beta^{2} - B_{11}^{s}k_{1}A'\lambda^{3} + L\lambda \end{bmatrix} u_{mn} \\ + \begin{bmatrix} -k_{2}B'J_{1}\beta\omega_{n}^{2} - (B_{12}^{s}k_{1}A' + B_{66}^{s}(k_{1}A' + k_{2}B'))\beta\lambda^{2} - B_{22}^{s}k_{2}B'\beta^{3} + L\beta \end{bmatrix} v_{mn} \\ + \begin{bmatrix} -\omega_{n}^{2}(-J_{2}(k_{1}A'\lambda^{2} + k_{2}B'\beta^{2}) + J_{0}) + D_{11}^{s}k_{1}A'\lambda^{4} + (D_{12}^{s} + 2D_{66}^{s})(k_{1}A' + k_{2}B')\lambda^{2}\beta^{2} \\ + D_{22}^{s}k_{2}B'\beta^{4} - L_{a}(\lambda^{2} + \beta^{2}) + g(0)N^{T}(\lambda^{2} + \beta^{2}) - 2N_{xy}^{T}g(0)(\lambda\beta) \end{bmatrix} w_{mn} \\ + \begin{bmatrix} -\omega_{n}^{2}(K_{2}((k_{1}A'))^{2}\lambda^{2} + (k_{2}B')^{2}\beta^{2}) + K_{0}) - (k_{1}A')^{2}H_{11}^{s}\lambda^{4} - (k_{2}B')^{2}H_{22}^{s}\beta^{4} \\ - (2H_{12}^{s}k_{1}A'k_{2}B' + H_{66}^{s}(k_{1}A' + k_{2}B')^{2})\lambda^{2}\beta^{2} \\ + (-F_{55}^{s}(k_{1}A')^{2} + 2k_{1}A'R - 2k_{1}A'X_{55}^{s} - A_{55}^{s})\lambda^{2} \\ + (-F_{44}^{s}(k_{2}B')^{2} + 2k_{2}B'R - 2k_{2}B'X_{44}^{s} - A_{44}^{s})\beta^{2} - R_{a} + N^{T}g(0)^{2}(\lambda^{2} + \beta^{2}) - 2N_{xy}^{T}g(0)^{2}(\lambda\beta) \end{bmatrix} \theta_{nn} = 0$$

295

By finding the determinant of the coefficient matrix of the above equations and setting this multinomial to zero, we can find natural frequencies ω_n :

(33d)

298
$$det \begin{bmatrix} d_{11} & d_{12} & d_{13} & d_{14} \\ d_{21} & d_{22} & d_{23} & d_{24} \\ d_{31} & d_{32} & d_{33} & d_{34} \\ d_{41} & d_{42} & d_{43} & d_{44} \end{bmatrix} = 0$$

Where the different components of the previous matrix are presented in Appendix B, (Eq.B.1).

301 5. Findings and discussion

Evaluations are made with analytical and numerical results published by various researchers. Additionally, the solutions in the tables and graphs are revealed in nondimensional formulas that are proposed as follows:

$$305 \qquad \overline{\beta} = \omega_n h \sqrt{\rho_c / E_c}$$

$$306 \qquad \overline{\psi} = \omega_n h \sqrt{\rho_m / E_m}$$

307
$$\overline{\omega} = \omega_n \left(a^2 / h \right) \sqrt{\rho_0 \left(1 - {v_0}^2 \right) / E_0}$$

308 Where: $v_0 = 0.28$

309
$$K_w = k_w D_0 / a^4$$
, $K_p = k_p D_0 / a^2$

- 310 $K_l = k_l D_0 / a^4$, $K_u = k_u D_0 / a^4$, $K_s = k_s D_0 / a^2$
- 311 Where: $D_0 = E_0 h^3 / 12 (1 v^2)$

312 ρ_0 and E_0 are the parameters of metal at ambient temperature (300K).

The proposed shear deformation theory results, based on four variables, are verified in Table 2 by comparing the fundamental frequencies of FG square plates $Al_2/Al O_3$ with the exact results published by Zaoui et al. [28] using five variables. Furthermore, the fundamental frequencies are given for different slenderness ratios (a/h=5, 10, and 20) and the first three modes. The comparison concludes that the proposed theory functions correctly and matches the results previously published by Zaoui et al. [28].

Additionally, the proposed theory's results are compared with those published by Zaoui et al. [28] and Mengzhen et al. [39] for FG square plates Al₂/AlO₃ lying on elastic foundations by considering different power-law indexes, see Tables 3 and 4.

Finally, the fundamental frequencies of FG plates composed of (Si₃N₄-SUS304) are compared with those published by Huang and Shen, [3]; Parida and Mohanty [6], and Zaoui et al. [19] for (a/h=5 and 20), see Table 5. Calculations are performed for these FG plates with the subsequent properties: a/b=1, a=8h, $\rho_c=2770 \ kg/m^3$, $\rho_m=8166 \ kg/m^3$, and $v_c=v_m=0.28$, $K_c=9.19 \ W/mK$, and $K_m=12.04 \ W/mK$. Importantly, the present results reported in Table 5 agree satisfactorily with the published ones. The present method can successfully calculate the 3D dynamic response of FG plates exposed to nonlinear temperature rise.

As mentioned in Figure 2, the thermal conductivity will be considered temperaturedependent to meet the required results. Notably, the examination of Table 6 reveals that the natural frequencies in temperature-dependent are lower than those in temperature-independent plates.

Variations of fundamental frequencies of the FGM plates lying on Winkler/Pasternak and Kerr foundations at different temperatures on the ceramic side are shown in Tables 7 and 8, wherein the first five modes of free vibration are presented. The fundamental frequencies are evaluated for different k. The temperature of the bottom side is kept constant at T_m = 300*K*, while two different temperatures of the top side are considered with a rise of 100 and 300*K* from reference temperature (T_0 =300*K*). Additionally, the variation of fundamental frequencies with change in temperature of the upper side is also shown in Tables 7 and 8.

Variations of the fundamental frequencies versus foundation parameters of plates lying on Winkler and Pasternak elastic foundation are respectively shown in Figures 3(a)-(b) and Figures 3(c)-(d) for different power-law index k and modes (1 and 3). All the plates are subjectebd to a nonlinear thermal rise of 400K. It is noted that by increasing the power-law index, the fundamental frequencies decrease whatever the type of foundation. This decrease is because an increase in the power-law index decreases the elasticity modulus. In other words, 346 the plate becomes softer as the metal's volume fraction increases, thus decreasing the 347 frequencies' values.

The variation of Winkler foundation stiffness slightly affects the fundamental frequencies only in the first mode, see Figure 3(a). Otherwise, its influence is neglected, see Figure 3(b). However, the results presented in Figures 3(c)-(d) show that the fundamental frequencies of the plate increase with the increase of Pasternak foundation's stiffness, whatever k, and the mode vibration. Because when the parameter k_p increases, it increases the bending stiffness of the plate and therefore entrains the increase of the natural frequency.

354 Variations of the fundamental frequencies of FG plates subjected to nonlinear temperature difference and resting on Winkler/Pasternak elastic foundation are respectively 355 356 shown in Figures 4(a)-(b) using a power-law index k=1. The maximum values of fundamental frequencies are obtained for $(k_w = k_p = 100)$; this is due mainly to the inclusion of the shear 357 358 layer, which stabilizes the lateral movement of the plate. However, the minimum ones are reached for plates without shear layer $(k_p=0)$. The fundamental frequencies decrease with the 359 360 increase of the environment temperature's change. The reason is that increasing the temperature results in a decrease of the material rigidity while the system's mass remains 361 362 constant.

Figure 5 gives the fundamental frequencies of various plates versus Kerr foundation's 363 parameters $(k_l, k_u, and k_s)$ under a nonlinear temperature change of 400K using a different 364 power-law index. Whatever the power-law index, all the curves exhibit almost the same 365 evolution. The fundamental frequencies fall rapidly when the parameter of the lower elastic 366 layer is small ($k_l < 30$), while they slowly change when $k_l > 30$, see Figure 5(a). However, they 367 rise rapidly when the parameter of the upper elastic layer is small ($k_u < 30$), while they slowly 368 change when $k_u>30$, see Figure 5(b). More importantly, Figure 5(c) gives the fundamental 369 natural frequency versus shear layer parameter for different FG plates. Notably, the 370 fundamental frequencies increase considerably as the shear parameter (k_s) increases. 371

The effect of parameters $(k_l, k_u, k_s, \Delta T)$ on the fundamental frequencies of square plates is also studied, see Figure 6. Based on the variation of slope of fundamental frequencies, it is observed that increasing (k_l, k_u, k_s) has an insignificant influence on the effect of the ΔT on the frequency of homogenous as well as FG plates. In other words, whatever the Kerr foundation's parameters, the fundamental frequencies decrease slightly as ΔT increases. However, the lower spring, upper spring, and shear layer parameters have rising effects on the fundamental frequencies of FG plates.

Figures 7(a)-(b) and Figures 7(c)-(d) display a 3D analysis of fundamental frequency versus slenderness ratio a/h for homogenous plate (k=0) and FG square plates lying on two types of foundation and exposed to various nonlinear temperature changes: 0, 100, 200, 300, and 400K, respectively. As highlighted in Figure 7, the first natural frequencies are almost constant at $\Delta T=0$, whatever the foundation type. But, for high-temperature changes, the frequencies fall with growing a/h until it becomes zero. Therefore, the critical slenderness ratio for plates lying on the Winkler-Pasternak foundation is higher than that on the Kerr foundation.

Figures 8(a)-(b) and Figures 8(c)-(d) show the influence of the aspect ratio b/a on the fundamental frequencies of the homogenous plate (k=0) and FG square plates lying on two types of foundation and exposed to various nonlinear temperature changes: 0, 100, 200, 300, and 400 K, respectively. Importantly, it is found that increasing b/a reduces the frequencies of the structures significantly. More importantly, the fundamental frequencies drop rapidly when the aspect ratio is small (b/a < 6) while they become constant b/a > 6, see Figure 8(a). Furthermore, the frequencies are decreased with increasing the temperature change ΔT , and this effect becomes more remarkable with increasing the aspect ratio b/a.

411 6. Conclusions

In this study, the new four-unknown shear deformation theory is used to analyze the 3D free thermal vibration of FGM plates for the first time. The governing equations are established based on Hamilton's principle. Validation studies have been performed to confirm the relevance of the current theory formulation. The obtained results are very similar to those published by various researchers.

- The increase in elastic foundation parameters would enhance the free-vibrational response of homogenous and FG plates in the same manner. However, this increase has an insignificant influence on the effect of the temperature change (ΔT) on the fundamental frequencies of these structures.
- The increase in the temperature change (ΔT) softens the FG plate and reduces the natural frequency. This reduction is related to the compressive stress caused by the thermal gradients.
- The effect of the plate's configuration is more significant when the nonlinear temperature difference (ΔT) is at high levels.
- Even at high temperatures, the Pasternak/Kerr foundation models are suitable for
 performing free-vibrational analysis of FG plates using large values of shear layer
 stiffness.
- Pasternak foundation model is better suited for the free-vibrational response of FG
 plates than the Kerr foundation model. For large values of upper spring modulus, the
 Kerr model tends to that of Pasternak.

782 **Biographies**

Belgacem MAMEN holds a MSc degree (2010) in Modeling and Experimentation in Solid 783 Mechanics from Joseph Fourier University and INPG Institute, Grenoble (FRANCE). He 784 received his Ph.D. degree (2013) in Engineering Sciences (Mechanics, Mechanical 785 Engineering, Civil Engineering) from Franche-Comté University, Besancon (FRANCE). He 786 is an Associate Professor in Structural Engineering at the Department of Civil Engineering at 787 788 Abbes Laghrour University of Khenchela (ALGERIA). He has supervised three Ph.D. theses and more than ten MSc students. His interests include experimental research, composite 789 material, thermomechanical modeling, numerical analysis, and programming, especially 790 791 Maple and ABAQUS.

Abdelhakim BOUHADRA holds a Ph.D. degree (2015) in Civil Engineering from Djillali
Liabes University of Sidi Bel Abbes (ALGERIA). He is an Associate Professor in Structural
Engineering at the Department of Civil Engineering at Abbes Laghrour University of
Khenchela (ALGERIA). He has supervised more than 5 Ph.D. and 10 MSc students.
Moreover, he has published more than 20 journal papers. His research interests include
composite structures, nanocomposites and mechanics of nano-structures, numerical analysis,
and programming, especially Maple.

Fouad BOURADA holds a Ph.D. degree (2018) in Civil Engineering from Belhadj Bouchaib
University of Ain Temouchent, Ain Temouchent (ALGERIA). He is an Associate Professor at
the Department of Science and Technology, Center University of Tissemsilt, Ben Hamouda
(ALGERIA). His research interests include Plate/beam theories, composite structures,
functionally graded structures, nanocomposite structures, nanoplates, nanobeams, and nonlocal elasticity.

Mohamed BOURADA holds a Ph.D. degree (2013) in Civil Engineering from Djillali Liabes
University of Sidi Bel Abbes (ALGERIA). He is a Professor at the Department of Civil
Engineering, Djillali Liabes University of Sidi Bel Abbes (ALGERIA). His research interests
include Topics: Functionally graded material, Plate theory, Beam (structure), Boundary value
problems, and Virtual work.

Abdelouahed TOUNSI obtained his Ph.D. degree (2002) at the University of Sidi-Bel-Abbes, Bel Abbes (ALGERIA). He is a Professor at the Civil Engineering Department, University of Sidi-Bel-Abbes, Bel Abbes (ALGERIA). He is an active researcher, producing more than 682 papers in index journals. He is also a member of several national and international organizations. His research interests include Plate/beam theories, composite structures, functionally graded structures, nanocomposite structures, nanoplates, nanobeams, and non-local elasticity.

Muzamal HUSSAIN holds a Ph.D. in Mechanics and Energy from the University of Lille
(FRANCE). He is an Assistant Professor at National Textile University Faisalabad (Pakistan).

Muzamal does research in Discrete Mathematics, Algorithm Analysis, Applied Mathematics,
Wave Propagation, Vibration Analysis, and functionally graded structures.
