Traveling Wave Solutions of the Sine-Gordon and the Coupled Sine-Gordon Equations Using the Homotopy-Perturbation Method

A. Sadighi¹, D.D. Ganji¹,* and B. Ganjavi²

Abstract. In this research, the Homotopy-Perturbation Method (HPM) has been used for solving sine-Gordon and coupled sine-Gordon equations, which have a wide range of applications in physics. HPM deforms a difficult problem into a simple one which can be easily solved. The results obtained by HPM are then compared with those of the Adomian Decomposition Method (ADM). The method has been shown to effectively, easily and accurately solve a large class of nonlinear problems with approximations converging rapidly to accurate solutions.

Keywords: Sine-Gordon equation; Coupled sine-Gordon equation; Homotopy-perturbation method; Traveling wave solution.

INTRODUCTION

Most of the problems and phenomena in different fields of science occur nonlinearly, especially in fluid mechanics, solid state physics, plasma physics, plasma waves, thermo-elasticity and chemical physics. Except in a limited number of these problems, we encounter difficulties in finding their exact analytical solutions. Therefore, approximate analytical solutions, such as Backlund transformation [1], Darboux transformation [2], Hirota’s bilinear method [3], the tanh method [4,5], the sine-cosine method [5,6], the homogeneous balance method [7,8], the exp-function method [9-11] the Adomian decomposition method [12-14], the variational iteration method [15-20] and the homotopy perturbation method [21-29], are introduced, among which the homotopy perturbation method [21-29] is the most effective and convenient for both weakly and strongly nonlinear problems.

HPM was first proposed by He. The method does not depend on a small parameter in the equation. Using the homotopy technique in topology, a homotopy is constructed with an embedding parameter, \( p \in [0, 1] \), which is considered as a “small parameter”. HPM was successfully applied to different branches of science and engineering, such as: nonlinear oscillation equations [30,31], heat transfer equations [32-34], mechanics of fluids [35,36] and etc.

The main objective of this paper is to employ HPM for solving sine-Gordon and coupled sine-Gordon equations. The capability, effectiveness and convenience of the method are revealed by obtaining the analytical solutions of the models and comparing with ADM.

FUNDAMENTALS OF THE HOMOTOPY PERTURBATION METHOD

To illustrate the basic ideas of the method, we consider the following equation [21]:

\[
A(u) - f(r) = 0, \quad r \in \Omega, \tag{1}
\]

subject to the boundary condition of:

\[
B \left( u, \frac{\partial u}{\partial n} \right) = 0, \quad r \in \Gamma, \tag{2}
\]
where $A$ is a general differential operator, $B$ a boundary operator, $f(r)$ a known analytical function and $\Gamma$ the boundary of the domain, $\Omega$.

$A$ can be divided into two parts, which are $L$ and $N$, where $L$ is linear and $N$ is nonlinear. Equation 1 can therefore be rewritten as follows:

$$L(u) + N(u) - f(r) = 0, \quad r \in \Omega.$$  \hspace{1cm} (3)

The Homotopy perturbation structure is shown as follows:

$$H(\nu, p) = (1-p)[L(\nu) - L(u_0)] + p[A(\nu) - f(r)] = 0,$$ \hspace{1cm} (4)

where:

$$\nu(r, p) : \Omega \times [0, 1] \rightarrow R.$$ \hspace{1cm} (5)

In Equation 4, $p \in [0, 1]$ is an embedding parameter and $u_0$ is the first approximation that satisfies the boundary condition. It can be assumed that the solution of Equation 4 can be written as a power series in $p$, as follows:

$$\nu = \nu_0 + \nu_1 p + \nu_2 p^2 + \cdots$$ \hspace{1cm} (6)

and the best approximation for the solution is:

$$u = \lim_{p \rightarrow 1} \nu = \nu_0 + \nu_1 + \nu_2 + \cdots.$$ \hspace{1cm} (7)

The above convergence is discussed in [21,22].

**IMPLEMENTATION OF THE METHOD**

In order to illustrate the advantages and accuracy of HPM, we will consider the sine-Gordon nonlinear hyperbolic equation and the coupled sine-Gordon equation.

**Sine-Gordon Equation**

We first study the sine-Gordon equation in the form of [37]:

$$u_{tt} - u_{xx} + \sin u = 0, \quad -\infty < x < \infty,$$ \hspace{1cm} (8)

subject to the initial conditions:

$$u(x, 0) = 0, \quad u_t(x, 0) = 4 \sec h(x),$$ \hspace{1cm} (9)

which has a wide range of applications in physics, not only in relativistic field theories but also in solid-state physics, nonlinear optics, etc. It also appears in a number of other physical applications, including the propagation of fluxons in Josephson junctions (a junction between two superconductors), the motion of a rigid pendulum attached to a stretched wire and dislocations in crystals.

In order to solve Equation 8, using HPM, we construct the following homotopy:

$$(1-p)u_{tt} + p(u_{tt} - u_{xx} + \sin u) = 0.$$ \hspace{1cm} (10)

Computing the Taylor series expansion of $\sin u$ about the point zero and substituting into Equation 10, Equation 10 transforms to:

$$(1-p)u_{tt} + p(u_{tt} - u_{xx} + \nu - \frac{1}{3!}\nu^3 + \frac{1}{5!}\nu^5 - \cdots) = 0.$$ \hspace{1cm} (11)

Substituting $\nu$ from Equation 6 into Equation 11 and rearranging, based on the powers of $p$-terms, we have:

$$p^0 : \frac{\partial^2 \nu_0}{\partial x^2} = 0,$$ \hspace{1cm} (12)

$$p^1 : \frac{\partial^2 \nu_1}{\partial x^2} - \frac{\partial^2 \nu_0}{\partial x^4} + \nu_0 - \frac{1}{6}\nu_0^3 + \frac{1}{120}\nu_0^5 = 0,$$ \hspace{1cm} (13)

$$p^2 : \frac{\partial^2 \nu_2}{\partial x^4} - \frac{\partial^2 \nu_1}{\partial x^4} + \nu_1 - \frac{1}{2}\nu_0^2\nu_1 + \frac{1}{24}\nu_0^4\nu_1 = 0.$$ \hspace{1cm} (14)

Solving Equations 12 to 14, we obtain:

$$\nu_0 = \frac{4t}{\cosh(x)},$$ \hspace{1cm} (15)

$$\nu_1 = -\frac{64t^2}{315 \cosh^3(x)} + \frac{8t^5}{15 \cosh^4(x)} - \frac{4t^3}{3 \cosh^4(x)},$$ \hspace{1cm} (16)

$$\nu_2 = \frac{512t^{13}}{30855 \cosh^6(x)} - \frac{128t^{11}}{1925 \cosh^7(x)}$$

$$+ \frac{4t^4(-42900 \cosh^3(x) + 143000 \cosh^2(x))}{2027025 \cosh^5(x)}$$

$$- \frac{4t^4(51480 \cosh^3(x) - 205920 \cosh^2(x))}{2027025 \cosh^5(x)},$$ \hspace{1cm} (17)

The solution of the sine-Gordon equation (Example 1), Equation 8, when $p \rightarrow 1$, will be as follows:

$$\nu = \nu_0 + \nu_1 + \nu_2,$$ \hspace{1cm} (18)

which is in good agreement with that obtained by ADM [37]. The behavior of $u(x,t)$ obtained by HPM, with different values of time, is shown in Figure 1. Figure 2 shows that the smaller the $t$ is, the more accurate the numerical solution obtained by HPM is. As $t$ becomes closer to 1, more terms must be considered for more accurate answers.
Coupled Sine-Gordon Equation

We next consider a system of a coupled sine-Gordon equation (Example 2) in the form of:

\[ u_{tt} - u_{xx} = -\delta^2 \sin(u - w), \quad (19) \]
\[ w_{tt} - c^2 w_{xx} = \sin(u - w), \quad (20) \]

which models one-dimensional nonlinear wave processes in two component media [38]. The coupled sine-Gordon equation generalizes the Frenkel-Kontorova dislocation model [39].

In order to solve the system of coupled sine-Gordon equations (Equations 19 and 20), using HPM, the following homotopy for these equations should be constructed as follows:

\[ (1 - p)u_{tt} + p(u_{tt} - u_{xx} + \delta^2 \sin(u - w)) = 0, \quad (21) \]

\[ (1 - p)w_{tt} + p(w_{tt} - c^2 w_{xx} - \sin(u - w)) = 0. \quad (22) \]

Computing the Taylor series expansion of \( \sin(u - w) \) about the point zero and substituting into Equations 21 and 22, these equations transform into:

\[ (1 - p)u_{tt} + p\left(u_{tt} - u_{xx} + \delta^2(u - w) + \frac{1}{3!}(u - w)^3 + \frac{1}{5!}(u - w)^5\right) = 0, \quad (23) \]

\[ (1 - p)w_{tt} + p\left(w_{tt} - c^2 w_{xx} - (u - w) + \frac{1}{3!}(u - w)^3 - \frac{1}{5!}(u - w)^5\right) = 0. \quad (24) \]

Substituting \( u \) and \( w \) from Equation 6 into Equation 11 and rearranging, based on the powers of \( p \)-terms, we have:

\[ p^0 : \begin{cases} 
\frac{\partial^2 u}{\partial t^2} = 0 \\
\frac{\partial^2 w}{\partial t^2} = 0 
\end{cases} \quad (25) \]

\[ p^1 : \begin{cases} 
\frac{\partial^2 u}{\partial t^2} - \frac{\partial^2 w}{\partial t^2} + \delta^2(u_0 - w_0) \\
+ \frac{1}{2} \delta^2(u_0^2 - w_0^2) + \frac{1}{6}(u_0^3 - w_0^3) + \frac{1}{24}(u_0^4 - w_0^4) \\
+ \frac{1}{24}(w_0^4 - u_0^4) = 0 
\end{cases} \quad (26) \]

Figure 1. The behavior of \( u(x, t) \) obtained by HPM for example 1.

Figure 2. The comparison of the results obtained by HPM and ADM for example 1, at: (a) \( t = 0.6 \), and (b) \( t = 1 \).
\[
\begin{align*}
\frac{\partial^2 u_0}{\partial t^2} &= \frac{\partial^2 u_1}{\partial t^2} + \phi^2(u_1 - w_1 + u_0 u_1 w_0 - u_0 w_0 w_1) \\
&+ \frac{1}{2} \phi^2 (u_0^2 w_1 - w_0^2 u_1) + \frac{1}{3} \phi^2 (w_0^2 w_1 - w_0^2 u_1) \\
&\quad + \frac{1}{4} \phi^2 (w_0 u_1 w_0^2 - u_0 u_1 w_0^2) \\
&\quad + \frac{1}{6} \phi^2 (u_0^2 w_1 - w_0^2 u_1 - u_0^2 u_1) \\
&+ w_1 - u_1 = 0
\end{align*}
\]

Solving Equations 25 to 27, we obtain:

\begin{equation}
\begin{align*}
u_0 &= A \cos(kx), \\
w_0 &= 0,
\end{align*}
\end{equation}

\begin{equation}
u_1 = \frac{1}{2} \phi^2 \left(-A \phi^2 \cos(kx) - A k^2 \cos(kx) \right) - \frac{1}{12} A^5 \phi^2 \cos^5(kx) + \frac{1}{6} A^5 \phi^2 \cos^3(kx) + \frac{1}{120} A^5 \phi^2 \cos^5(kx) + \frac{1}{6} A^5 \phi^2 \cos^3(kx)
\end{equation}

\begin{equation}
w_1 = \frac{1}{2} \phi^2 \left(A \cos(kx) - \frac{1}{6} A^3 \cos^3(kx) + \frac{1}{120} A^5 \cos^5(kx) \right)
\end{equation}

\begin{equation}
u_2 = \frac{1}{128} A \cos(kx) \left( \frac{1}{2} (\phi^2 + \phi^4 + k^4 + k^2 \phi^2 A^2) - \frac{1}{3} (\phi^2 + \phi^4) A^2 \cos^2(kx) + \frac{1}{15} (\phi^2 + \phi^4) A^4 \cos^4(kx) - \frac{1}{180} (\phi^2 + \phi^4) A^6 \cos^6(kx) \right)
\end{equation}

\begin{equation}
\begin{align*}
w_2 &= -\phi^4 A \cos(kx) \left( -\frac{1}{2160} (1 + \phi^2) A^6 \cos^6(kx) + \frac{1}{24} (1 + k^2 + \phi^2 + k^2 A^2) - \frac{1}{36} (1 + \phi^2) A^2 \cos^2(kx) + (1 + \phi^2) A^4 \cos^4(kx) - \frac{1}{144} (1 + \phi^2) A^4 \cos^4(kx) \right).
\end{align*}
\end{equation}

The solution of the coupled sine-Gordon equation (Equations 19 and 20), when \( p \to 1 \), will be as follows:

\begin{equation}
u = u_0 + u_1 + u_2,
\end{equation}

\begin{equation}
w = w_0 + w_1 + w_2,
\end{equation}

which are in excellent agreement with those obtained by ADM [38]. The behavior of \( u(x, t) \) and \( w(x, t) \) obtained by HPM, with different values of time, are shown in Figure 3. The accuracy and efficiency of HPM at some fixed values of time, compared with ADM, are shown in Figures 4 and 5.

**CONCLUSION**

In this study, we have successfully developed HPM for solving sine-Gordon and coupled sine-Gordon equations. It is apparently seen that HPM is a very powerful and efficient technique for finding solutions for wide classes of nonlinear problems in the form of analytical expressions and presents a rapid convergence for the solutions.

Many of the results attained in this paper confirm the idea that HPM is a powerful mathematical tool for solving different kinds of nonlinear problem arising in various fields of science and engineering. It is worth pointing out that, in order to achieve more accurate solutions for the sine-Gordon and the coupled sine-Gordon, more components of Equation 6 must be taken into account.

In conclusion, HPM provides highly accurate numerical solutions for nonlinear problems, in comparison with other methods. It also does not require a large computer memory and discretization of variables \( t \) and \( x \). As mentioned, this method avoids linearization and physically unrealistic assumptions.
