Magnetohydrodynamics; Peristaltic flow; Walter’s B fluid; Heat transfer; Slip condition; Regular perturbation method; Analytical solutions.

Abstract. The purpose of this paper is to investigate the effects of magnetohydrodynamic peristaltic flow of Walter’s B fluid in an inclined asymmetric channel under the influence of slip conditions. The effects of heat and mass transfer are also taken into account. Analytical solutions of nonlinear coupled equations are obtained by regular perturbation method. Graphs for different flow parameters of interest are sketched and analyzed. It is observed that the absolute value of shear stress and heat transfer coefficient decreases by increasing the magnetic parameter, whereas with the increase of magnetic parameter, concentration decreases. Opposite behavior has been noted for temperature and heat transfer coefficient at upper and lower walls against various values of Prandtl number, Eckert number, slip parameter, and material constant of Walter’s B fluid. Oscillatory behavior of heat transfer coefficient is observed, which is due to propagation of peristaltic waves along the walls of the channel.

1. Introduction

Peristaltic transport is a mechanism for mixing and transporting fluids, which is caused by a progressive wave of contraction and expansion travelling on the walls of the channel. The study of peristalsis has gained a distinct status amongst several researchers because of its various applications in physiological processes [1]. Moreover, effects of heat transfer have a significant role in peristalsis processes, such as oxygenation and hemodialysis. The properties of tissue can be pigconholed through heat transfer analysis. Heat is either produced or locally inserted to monitor the thermal clearance rate [2–5]. Likewise, the effects of magnetohydrodynamics in peristalsis are very much noteworthy in magnetic therapy, arterial flow, hyperthermia compressor, etc. Magnets could heat inflammations, ulceration, and several diseases of intestine and uterus. Recently, several studies have been made on the peristaltic motion of non-Newtonian fluids under different assumptions.

Furthermore, Beard and Walter [6] have proposed the constitutive equations for elasto-viscous fluids, which are formally known as Walters’ B liquids. The Walters’ B fluid model describes the performance of several polymeric liquids that come across in bioscience. It can tremendously predict the complex flow behavior of various industrial polymer solutions such as hydrocarbons, paints, etc. This model also incorporates the elastic properties of the fluids that are absolutely useful to understand certain extensional polymers. A very careful review of the literature divulges that amongst the viscoelastic fluids, the Walter’s B model has gained very little attention so far. Few studies containing the relevant works on the topic can be mentioned by the attempts [7–12] and several therein.

With all the aforementioned points in mind, one can clearly observe that no analysis for magnetohydrodynamic peristaltic flow of Walter’s B fluid in the presence of heat and mass transfer under the influence of slip conditions is accorded in available literature yet. The courtesy in exploring the said topic is a motivating factor for this study. In fact, we intend to strengthen our efforts to understand the problems having more complicated nature. This is particularly in modeling of peristaltic flow of non-Newtonian fluids in an inclined asymmetric channel. The constitutive relationship of Walter’s B fluid is used in the mathematical formulation of the problem. The resulting nonlinear governing equations are computed for the series solutions valid for small wave numbers and low Reynolds numbers. Graphs for magnetic parameter, slip parameter, heat transfer coefficient, Walter’s B fluid parameter, Prandtl number, Eckert’s number, Schmidt number, and Soret number are sketched and analyzed.

2. Mathematical formulation of the problem

Consider the Walter’s B fluid through an inclined asymmetric channel of peristaltic transport having width $d_1 + d_2$ such that the upper and lower walls are respectively at distances of $d_1$ and $d_2$ from the center line of the channel. The sinusoidal waves of different amplitudes and phases are moving along the channel walls with constant speed $c$. The upper and lower walls are maintained at temperatures $T_0$ and $T_1$, respectively. The upper and lower walls have different amplitudes $a_i (i = 1, 2)$ with phase difference $\phi (0 \leq \phi \leq \pi)$. The flow is considered in the direction of $\bar{X}$-axis, whereas $\bar{Y}$-axis is taken normal to it. In the laboratory frame, we seek the velocity field of the form:

$$\bar{V} = [\bar{U}(\bar{X}, \bar{Y}, \bar{t})\bar{V}(\bar{X}, \bar{Y}, \bar{t})0],$$

in which $\bar{U}$ and $\bar{V}$ are the velocity components in the longitudinal and transverse directions correspondingly. The geometry of the channel walls $\bar{H}_1$ and $\bar{H}_2$ is defined as:

$$\bar{H}_1(\bar{X}, \bar{t}) = d_1 + a_1 \sin \left[ \frac{2\pi}{\lambda} (\bar{X} - \bar{c} \bar{t}) \right] ,$$

$$\bar{H}_2(\bar{X}, \bar{t}) = -d_2 - a_2 \sin \left[ \frac{2\pi}{\lambda} (\bar{X} - \bar{c} \bar{t}) + \phi \right] .$$

Here, $\lambda$ is the wavelength and $\bar{t}$ is time.

The channel walls and magnetic field are inclined at angles $\omega$ and $\gamma$, respectively. A uniform magnetic field $B_0$ is applied in the transverse direction to the flow. The magnetic Reynolds number is taken small so that the induced magnetic field is neglected. Henceforth, the governing equations in the form of components are obtained as:

$$\frac{\partial \bar{U}}{\partial \bar{X}} + \frac{\partial \bar{V}}{\partial \bar{Y}} = 0,$$

$$\rho \left( \frac{\partial \bar{U}}{\partial \bar{t}} + \bar{U} \frac{\partial \bar{U}}{\partial \bar{X}} + \bar{V} \frac{\partial \bar{U}}{\partial \bar{Y}} \right) \bar{V} = -\frac{\partial \bar{P}}{\partial \bar{X}} + \frac{\partial \bar{S}_{XX}}{\partial \bar{X}},$$

$$\frac{\partial \bar{S}_{XY}}{\partial \bar{Y}} + \rho g \sin \omega - \sigma B_0^2 \cos \gamma (\bar{U} \cos \gamma - \bar{V} \sin \gamma),$$

$$\frac{\partial \bar{P}}{\partial \bar{t}} + \frac{\partial \bar{P}}{\partial \bar{X}} + \bar{V} \frac{\partial \bar{P}}{\partial \bar{Y}} \bar{V} = -\frac{\partial^2 \bar{T}}{\partial \bar{X}^2} + \frac{\partial \bar{T}}{\partial \bar{Y}^2},$$

$$\frac{\partial \bar{S}_{YY}}{\partial \bar{Y}} - \rho \cos \omega + \sigma B_0^2 \sin \gamma (\bar{U} \cos \gamma - \bar{V} \sin \gamma),$$

$$\rho \left( \frac{\partial \bar{V}}{\partial \bar{t}} + \bar{U} \frac{\partial \bar{V}}{\partial \bar{X}} + \bar{V} \frac{\partial \bar{V}}{\partial \bar{Y}} \right) \bar{V} = -\frac{\partial \bar{P}}{\partial \bar{Y}} + \frac{\partial \bar{S}_{YY}}{\partial \bar{Y}},$$

$$\frac{\partial \bar{S}_{XY}}{\partial \bar{X}} + \rho g \cos \omega + \sigma B_0^2 \sin \gamma (\bar{U} \cos \gamma - \bar{V} \sin \gamma),$$

$$\frac{\partial \bar{P}}{\partial \bar{t}} + \frac{\partial \bar{P}}{\partial \bar{Y}} + \bar{V} \frac{\partial \bar{P}}{\partial \bar{X}} \bar{V} = -\frac{\partial^2 \bar{T}}{\partial \bar{Y}^2} + \frac{\partial \bar{T}}{\partial \bar{X}^2}.$$
\[
S = \frac{d_1}{\eta c}, \quad v = \frac{\bar{v}}{c}, \quad \delta = \frac{d_1}{\lambda}, \quad \text{Re} = \frac{\rho c d_1}{\eta}, \quad \kappa = \frac{k_0}{\eta d_1}, \quad \text{Sr} = \frac{\rho D K_T (T_1 - T_0)}{\eta T_m (C_1 - C_0)}, \quad \text{Pr} = \frac{\xi \eta}{k}, \quad \text{Sc} = \frac{\eta}{\rho D}, \quad \text{Er} = \frac{c^2}{\xi (T_1 - T_0)}, \quad \nu = \frac{C - C_0}{C_1 - C_0}, \quad \Phi = \frac{d_1^2}{\eta c^2} \Phi, \quad \eta = \frac{T - T_0}{T_1 - T_0}, \quad M^2 = \frac{\sigma R_0 d_1^2}{\eta}\]

(13)

The Eq. (4) is identically satisfied and Eqs. (5) to (8) in terms of stream function can be expressed as follows:

\[
\begin{align*}
\delta \text{Re} \left[ \left( \frac{\partial \psi}{\partial y} \frac{\partial \psi}{\partial x} - \frac{\partial \psi}{\partial x} \frac{\partial \psi}{\partial y} \right) \frac{\partial \psi}{\partial y} \right] &= -\frac{\partial p}{\partial x} + \frac{\partial S_{xy}}{\partial x}, \\
&+ \frac{\partial S_{xy}}{\partial y} + \frac{\text{Re}}{\text{Fr}} \sin \omega - M^2 \cos \gamma \\
&\left( \frac{\partial \psi}{\partial y} + 1 \right) \cos \gamma + \frac{\partial \psi}{\partial x} \sin \gamma. \\
-\delta \text{Re} \left[ \left( \frac{\partial \psi}{\partial y} \frac{\partial \psi}{\partial x} - \frac{\partial \psi}{\partial x} \frac{\partial \psi}{\partial y} \right) \frac{\partial \psi}{\partial x} \right] &= -\frac{\partial p}{\partial y} \\
&+ \delta^2 \frac{\partial S_{xy}}{\partial x} + \frac{\partial S_{yy}}{\partial y} - \frac{\text{Re}}{\text{Fr}} \cos \omega + M^2 \delta \cos \gamma \\
&\left( \frac{\partial \psi}{\partial y} + 1 \right) \cos \gamma + \frac{\partial \psi}{\partial x} \sin \gamma.
\end{align*}
\]

(14)

(15)

The resulting heat and thermos-diffusion equations become:

\[
\begin{align*}
\delta \text{Re} \left[ \frac{\partial \psi}{\partial y} \frac{\partial \eta}{\partial x} - \frac{\partial \psi}{\partial x} \frac{\partial \eta}{\partial y} \right] &= \frac{1}{\text{Fr}} \left( \epsilon^2 \frac{\partial^2 \eta}{\partial x^2} + \frac{\partial \eta}{\partial y^2} \right) + \text{Er} \Phi, \\
\delta \text{Re} \left[ \frac{\partial \psi}{\partial y} \frac{\partial \nu}{\partial x} - \frac{\partial \psi}{\partial x} \frac{\partial \nu}{\partial y} \right] &= \frac{1}{\text{Sc}} \left( \epsilon^2 \frac{\partial^2 \nu}{\partial x^2} + \frac{\partial \nu}{\partial y^2} \right) \\
&+ \text{Sr} \left( \epsilon^2 \frac{\partial^2 \eta}{\partial x^2} + \frac{\partial \eta}{\partial y^2} \right).
\end{align*}
\]

(16)

Here, bars have been omitted for simplicity.

Solving Eqs. (15) and (16), simultaneously, we get the following vorticity transport equation:

\[
\begin{align*}
\delta \text{Re} \left[ \left( \frac{\partial \psi}{\partial y} \frac{\partial \psi}{\partial x} - \frac{\partial \psi}{\partial x} \frac{\partial \psi}{\partial y} \right) \nabla^2 \psi \right] &= \left( \frac{\partial \nu}{\partial y^2} - \delta^3 \frac{\partial \nu}{\partial x^2} \right) S_{xy} \\
&+ \delta \frac{\partial^2}{\partial x \partial y} (S_{xx} - S_{yy}) - M^2 \delta \frac{\partial \psi}{\partial y^2} \left( \frac{\partial \psi}{\partial y} + 1 \right) \cos \gamma \\
&+ \frac{\partial \psi}{\partial x}.
\end{align*}
\]

(18)

where:

\[
\nabla^2 = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}.
\]

(19)

The components of the extra-stress tensor are:

\[
S_{xx} = 4 \delta \psi_{xx} - 4k \left[ \delta^2 \psi_{y} \psi_{xx} + \delta^2 \psi_{x} \psi_{xy} - 2 \delta \psi_{x}^2 \right] \\
+ \delta^2 \psi_{xx} \psi_{yy} - \delta^4 \psi_{xx}^2.
\]

(20)

\[
S_{xy} = 2 (\psi_{yy} - \delta^2 \psi_{xx}) - 2k \left[ \delta \psi_{y} \psi_{yy} - \delta^3 \psi_{y} \psi_{xx} \\
- \delta \psi_{x} \psi_{yy} + \delta^3 \psi_{x} \psi_{xx} - 3 \delta \psi_{xy} \psi_{xy} \\
+ \delta \psi_{yy} \psi_{xx} + \delta^3 \psi_{y} \psi_{xy} - \delta^3 \psi_{xx} \psi_{xy} \right].
\]

(21)

\[
S_{yy} = -4 \delta \psi_{yy} - 4k \left[ \delta^2 \psi_{y} \psi_{yy} + \delta^2 \psi_{x} \psi_{xy} \\
- \psi_{yy}^2 + \delta^2 \psi_{xx} \psi_{yy} - 2 \delta^2 \psi_{xy} \right].
\]

(22)

\[
\Phi = \left[ 4 \delta^2 \psi_{xx}^2 - 4k \delta^2 \psi_{x} \psi_{xy} + 4k \delta^3 \psi_{x} \psi_{xx} \psi_{yy} \\
+ 8k \delta^3 \psi_{xx}^3 - 12k \delta^3 \psi_{y} \psi_{yy} \psi_{xx} + 6k \delta^5 \psi_{yy} \psi_{xx}^2 + 2 \psi_{yy}^2 - 4k \delta^2 \psi_{y} \psi_{yy} \psi_{xx} - 2k \delta \psi_{y} \psi_{yy} \psi_{xy} \\
+ 2k \delta^2 \psi_{y} \psi_{yy} \psi_{xy} + 2k \delta \psi_{y} \psi_{yy} \psi_{yy} \\
- 2k \delta^3 \psi_{y} \psi_{yy} \psi_{xy} + 6k \delta \psi_{yy} \psi_{yy} \psi_{xx} - 6k \delta \psi_{yy} \psi_{xy} \\
+ 2k \delta^3 \psi_{yy} \psi_{yy} \psi_{xx} + 2k \delta^4 \psi_{xy}^2 - 2k \delta \psi_{y} \psi_{xx} \psi_{xy} \\
- 2k \delta^5 \psi_{y} \psi_{xx} \psi_{xy} - 2k \delta^3 \psi_{y} \psi_{xx} \psi_{yy} \\
+ 2k \delta^5 \psi_{y} \psi_{xx} \psi_{yy} + 6k \delta^4 \psi_{xx} \psi_{xy} + 4k \delta^2 \psi_{xy}^2 \\
- 4k \delta^3 \psi_{y} \psi_{xx} \psi_{xy} + 2k \delta^3 \psi_{y} \psi_{yy} \psi_{xx} - 8k \delta^3 \psi_{xx}^2 \right].
\]

(23)

3. Boundary conditions

In wave frame, the equations of boundary conditions for dimensionless stream function are:

\[
\psi = \frac{F}{2 \text{Fr}} \frac{\partial \psi}{\partial y} + \beta S_{xy} = -1, \quad \psi = 0 \text{ at } y = \eta_1 (x),
\]

(24)

\[
\psi = \frac{F}{2 \text{Fr}} \frac{\partial \psi}{\partial y} - \beta S_{xy} = -1, \quad \psi = 1 \text{ at } y = \eta_2 (x).
\]

(25)

The dimensionless flux \( F \) is defined by the following
relation [14]:

\[ F = \int_{h_1(x)}^{h_2(x)} \frac{\partial \psi}{\partial y} \, dy. \]  

In the laboratory frame, dimensionless average flux is obtained as:

\[ \theta = F + 1 + d. \]  

4. Methodology

The perturbation method for small wave number \( \delta (\delta \ll 1) \), which is appropriate in the study of peristaltic flow in tubes or channels, is used for solving the problem. Thus, we expand the flow quantities as:

\[
\begin{align*}
\psi &= \psi_0 + \delta \psi_1 + O(\delta^2) \\
\eta &= \eta_0 + \delta \eta_1 + O(\delta^2) \\
\nu &= \nu_0 + \delta \nu_1 + O(\delta^2) \\
S &= S_0 + \delta S_1 + O(\delta^2) \\
Z &= Z_0 + \delta Z_1 + O(\delta^2)
\end{align*}
\]

(28)

Substituting Eq. (28) into Eqs. (17) to (19) along with boundary conditions given in Eqs. (24) and (25), and collecting the like terms of \( \Theta(\delta) \), we obtain the following zeroth- and first-order problems.

4.1. Zeroth-order system

Collecting the coefficients of like terms of \( O(\delta) \), we obtain:

\[
\begin{align*}
\frac{\partial^2 S_{\text{xy}}}{\partial y^2} &= M^2 \cos^2 \gamma \frac{\partial^2 \psi_0}{\partial y^2}. \\
\frac{1}{Pr} \frac{\partial \eta_0}{\partial y} + \text{Er} \Phi_0 &= 0, \\
\frac{1}{Sc} \frac{\partial \nu_0}{\partial y} + \frac{\partial \eta_0}{\partial y} &= 0, \\
S_{\text{xx}} &= 0, \\
S_{\text{yy}} &= 2 \frac{\partial^2 \psi_0}{\partial y^2}, \\
S_{\text{yy}} &= 4k \left( \frac{\partial \psi_0}{\partial y^2} \right)^2, \\
\Phi_1 &= 4 \frac{\partial^2 \psi_0}{\partial y^2} \left( \frac{\partial \psi_0}{\partial y^2} \right)^2.
\end{align*}
\]

(29) \hspace{1cm} (30) \hspace{1cm} (31) \hspace{1cm} (32) \hspace{1cm} (33)

The corresponding boundary conditions are:

\[
\begin{align*}
\psi_0 &= \frac{F_0}{2}, \quad \frac{\partial \psi_0}{\partial y} + \beta S_{\text{xy}} = -1, \quad \eta_0 = 0, \\
\nu_0 &= 0 \quad \text{at} \quad y = h_1(x), \\
\psi_0 &= -\frac{F_0}{2}, \quad \frac{\partial \psi_0}{\partial y} + \beta S_{\text{xy}} = -1, \quad \eta_0 = 1, \\
\nu_0 &= 1 \quad \text{at} \quad y = h_2(x).
\end{align*}
\]

(34) \hspace{1cm} (35)

The heat coefficient at upper and lower walls can be calculated by the relations:

\[
Z_{\theta h_1} = \frac{\partial \theta_{h_1}}{\partial x} \frac{\partial \theta_{h_1}}{\partial y}, \quad Z_{\theta h_1} = \frac{\partial \theta_{h_1}}{\partial x} \frac{\partial \theta_{h_1}}{\partial y}.
\]

(36)

4.2. First-order system

The coefficients of \( \delta \) yield the following problems:

\[
\begin{align*}
\frac{\partial^2 S_{\text{xy}}}{\partial y^2} + \frac{\partial^2 S_{\text{xx}}}{\partial x \partial y} &= \frac{\partial S_{\text{yy}}}{\partial y} \\
+ \text{Re} \left[ \frac{\partial \psi_0}{\partial y} \frac{\partial^2 \psi_0}{\partial x \partial y^2} - \frac{\partial \psi_0}{\partial x} \frac{\partial^2 \psi_0}{\partial y^3} \right] \\
+ \frac{M^2}{\cos^2 \gamma} \left( \frac{\partial^2 \psi_0}{\partial x \partial y} + \frac{\partial^2 \psi_0}{\partial y \partial x} \right) \\
+ \sin \gamma \cos \gamma \frac{\partial^2 \psi_0}{\partial x \partial y}.
\end{align*}
\]

(37)

\[
\begin{align*}
\frac{1}{Pr} \frac{\partial \eta_1}{\partial y} + \text{Er} \Phi_1 &= \text{Re} \left[ \frac{\partial \psi_0}{\partial y} \frac{\partial \psi_0}{\partial x} \frac{\partial \psi_0}{\partial x} \frac{\partial \psi_0}{\partial y} \right], \\
\frac{1}{Sc} \frac{\partial \nu_1}{\partial y} + \frac{\partial \eta_1}{\partial y} &= \text{Re} \left[ \frac{\partial \psi_0}{\partial y} \frac{\partial \psi_0}{\partial x} \frac{\partial \psi_0}{\partial x} \frac{\partial \psi_0}{\partial x} \right], \\
S_{\text{xx}} &= 4 \frac{\partial^2 \psi_0}{\partial x \partial y} + 8k \left( \frac{\partial \psi_0}{\partial y} \right)^2, \\
S_{\text{xy}} &= 2 \frac{\partial^2 \psi_0}{\partial y^2} - 2k \frac{\partial \psi_0}{\partial y} \frac{\partial \psi_0}{\partial x \partial y} + 2k \frac{\partial \psi_0}{\partial x} \frac{\partial^2 \psi_0}{\partial y^2} + 4k \frac{\partial \psi_0}{\partial x} \frac{\partial \psi_0}{\partial y} \frac{\partial \psi_0}{\partial y} \frac{\partial \psi_0}{\partial y} - 4 \frac{\partial \psi_0}{\partial x} \frac{\partial \psi_0}{\partial x} \frac{\partial \psi_0}{\partial y} \frac{\partial \psi_0}{\partial y} \\
\Phi_1 &= 4 \frac{\partial^2 \psi_0}{\partial y^2} \left( \frac{\partial \psi_0}{\partial y} \right)^2 + 6k \left[ \frac{\partial \psi_0}{\partial x} \frac{\partial \psi_0}{\partial y} \left( \frac{\partial \psi_0}{\partial y} \right)^2 - \frac{\partial \psi_0}{\partial x} \frac{\partial \psi_0}{\partial y} \frac{\partial \psi_0}{\partial y} \right] \\
+ 2k \left[ \frac{\partial \psi_0}{\partial x} \frac{\partial \psi_0}{\partial y} \left( \frac{\partial \psi_0}{\partial y} \right)^2 - \frac{\partial \psi_0}{\partial x} \frac{\partial \psi_0}{\partial y} \frac{\partial \psi_0}{\partial y} \frac{\partial \psi_0}{\partial y} \right].
\end{align*}
\]

(38) \hspace{1cm} (39) \hspace{1cm} (40) \hspace{1cm} (41) \hspace{1cm} (42) \hspace{1cm} (43)

The corresponding boundary conditions are:

\[
\begin{align*}
\psi_1 &= \frac{F_1}{2}, \quad \frac{\partial \psi_1}{\partial y} + \beta S_{\text{xy}} = 0, \quad \eta_1 = 0, \\
\nu_1 &= 0 \quad \text{at} \quad y = h_1(x), \\
\psi_1 &= -\frac{F_1}{2}, \quad \frac{\partial \psi_1}{\partial y} - \beta S_{\text{xy}} = 0, \quad \eta_1 = 0, \\
\nu_1 &= 0 \quad \text{at} \quad y = h_2(x).
\end{align*}
\]

(44) \hspace{1cm} (45)
The heat coefficients at upper and lower walls are defined by the relations:

\[
Z_{1h_1} = \frac{\partial h_1}{\partial x} \frac{\partial h_1}{\partial y}, \quad Z_{2h_1} = \frac{\partial h_2}{\partial x} \frac{\partial h_1}{\partial y}. \tag{46}
\]

5. Solution of the problem

5.1. Zeroth-order solution

The solutions of Eqs. (29) to (36) along with the heat coefficient at upper and lower walls are given by:

\[
\psi_0 = A_1 y + A_2 + A_3 \cosh \alpha y + A_4 \sinh \alpha y, \tag{47}
\]

\[
S_{0x y} = 2 \alpha^2 (A_3 \cosh \alpha y + A_4 \sinh \alpha y), \tag{48}
\]

\[
\eta_0 = A_5 + A_6 y + A_7 y^2 + A_8 \cosh 2 \alpha y + A_9 \sinh 2 \alpha y, \tag{49}
\]

\[
\nu_0 = A_{10} + A_{11} y + A_{12} y^2 + A_{13} \cosh 2 \alpha y + A_{14} \sinh 2 \alpha y, \tag{50}
\]

\[
Z_{0h_1} = a \cos x (A_0 + 2 A_7 y + 2 \alpha A_8 \sinh 2 \alpha y + 2 \alpha A_9 \cosh 2 \alpha y), \tag{51}
\]

\[
Z_{0h_2} = - b \cos (x + \phi) (A_0 + 2 A_7 y + 2 \alpha A_8 \sinh 2 \alpha y + 2 \alpha A_9 \cosh 2 \alpha y), \tag{52}
\]

5.2. First-order solution

Upon making use of zeroth-order solution in the first-order system and then solving the resulting problems, one arrives at:

\[
\psi_1 = B_1 + B_2 y + \cosh \alpha y (B_{11} + B_{12} y + B_{13} y^2) + B_{31} y^2 + \sinh \alpha y (B_{71} + B_{72} y + B_{73} y^2). \tag{53}
\]

\[
S_{1x y} = D_{10} + \cosh \alpha y (B_{11} + B_{12} y + B_{13} y^2) + B_{17} \cosh 2 \alpha y + \sinh \alpha y (B_{14} + B_{15} y + B_{16} y^2) + B_{18} \sinh 2 \alpha y, \tag{54}
\]

\[
\eta_1 = B_{19} + B_{20} y + B_{22} y^2 \sinh \alpha y (B_{24} + B_{25} y + B_{26} y^2 + B_{27} y^2 + \cosh \alpha y (B_{28} + B_{29} y + B_{30} y^2) + B_{31} \sinh 3 \alpha y + \sinh 2 \alpha y (B_{30} + B_{31} y + B_{32} y^2 + B_{33} \cosh 2 \alpha y + B_{34} y + B_{35} y^2) + B_{36} \cosh 3 \alpha y). \tag{55}
\]

\[
\nu_1 = B_{38} + B_{39} y + B_{40} y^2 + \sinh \alpha y (B_{41} + B_{42} y + B_{43} y^2 + B_{44} y^3 + B_{45} y^4 + \cosh \alpha y (B_{46} + B_{47} y + B_{48} y^2) + \sinh 2 \alpha y (B_{40} + B_{50} y + B_{51} y^2 + B_{52} \sinh 3 \alpha y + \cosh 2 \alpha y (B_{50} + B_{53} y + B_{54} y^2) + B_{56} \cosh 3 \alpha y). \tag{56}
\]

Heat transfer coefficient is:

\[
Z_{1h_1} = a \cos x (\cosh \alpha y (B_{28} + \alpha B_{24} + (\alpha B_{25} + 2 B_{20} y + \alpha B_{20} y^2) + \sinh \alpha y (B_{25} + \alpha B_{27} + (\alpha B_{28} + 2 B_{20} y + 2 \alpha B_{20} y^2) + 2 B_{21} y + \cosh 2 \alpha y (B_{34} + 2 \alpha B_{30} + (2 \alpha B_{31} + 2 B_{35} y + 2 \alpha B_{32} y^2) + B_{20} + \sinh 2 \alpha y (B_{31} + 2 \alpha L_{33} + (2 \alpha B_{34} + 2 B_{32} y + 2 \alpha B_{32} y^2) + 3 \alpha B_{30} \sinh 3 \alpha y + 3 \alpha B_{37} \cosh 3 \alpha y + 3 B_{22} y^2 + 4 B_{23} y^3). \tag{57}
\]

\[
Z_{1h_2} = - b \cos (x + \phi) (\cosh \alpha y (B_{28} + \alpha B_{24} + (\alpha B_{25} + 2 B_{20} y + \alpha B_{20} y^2) + \sinh \alpha y (B_{25} + \alpha B_{27} + (\alpha B_{28} + 2 B_{20} y + 2 \alpha B_{20} y^2) + 3 B_{22} y^2 + \cosh 2 \alpha y (B_{34} + 2 \alpha B_{30} + (2 \alpha B_{31} + 2 B_{35} y + 2 \alpha B_{32} y^2) + B_{20} + 2 B_{21} y + 3 \alpha B_{30} \sinh 3 \alpha y + 3 \alpha B_{37} \cosh 3 \alpha y). \tag{58}
\]

The values appearing in Eqs. (47) to (58) are given in the Appendix.

6. Results and discussion

In this section, the effects of physical parameters such as viscoelastic parameter, \( \kappa \); MHD parameter, \( M \); slip parameter, \( \beta \); Eckert number, \( ER \); Prandtl number, \( Pr \); Schmidt number, \( Sc \); and Soret number, \( Sr \), have been displayed in Figures 1 to 11.

Figures 1 to 3 are prepared to discuss the variations of \( \kappa \), \( M \), and \( \beta \) on shear stress \( S_{xy} \). Figure 1 depicts that, by increasing \( K \), the absolute value of
shear stress at the upper wall $S_{xy(h_1)}$ and lower wall $S_{xy(h_2)}$, respectively. decreases and increases in the first half of the wave and then increases and decreases in the second half of the wave as increasing $\kappa$. Figure 2 shows that there is decrease in the absolute value of shear stress when $M$ increases. From Figure 3, it is found that with increasing the value of $\beta$, the absolute value of shear stress decreases.

**Figure 4.** Variations of (a) Pr and (b) Er on $\eta$.

**Figure 5.** Variations of (a) $\beta$ and (b) $\gamma$ on $\eta$.

**Figure 6.** Variations of (a) Sc and (b) Sr on $\nu$.

**Figure 7.** Variation of (a) $M$ and (b) on $\nu$.

**Figure 8.** Variations of Er on heat transfer coefficients: (a) $Z_{h_1}$ at upper wall; and (b) $Z_{h_2}$ at lower wall.

Figures 4 and 5 show the variations of Prandtl number, Pr, Eckert number, Er, and slip parameter, $\beta$, at inclination of magnetic field $\gamma$ on temperature $\eta$. From Figure 4, it is clear that by increasing Pr and Er, temperature $\eta$ increases. Figure 5 (a) illustrates the decrease in temperature $\eta$ with increase in $\beta$, whereas from Figure 5 (b), it is observed that temperature $\eta$ increases by increasing $\gamma$. 
These are not unexpected results as, based on the definition, the Prandtl number is a ratio of momentum diffusion to thermal diffusion; consequently, with increase in Pr, thermal diffusion decreases and, thus, thermal boundary layer becomes thinner. In other words, one can say that large values of Prandtl number result in thinning of thermal boundary layer. As a matter of fact, the increase of Prandtl number slows the rate of thermal diffusion. However, in the presence of viscous dissipation, the effect of increasing the values of Prandtl number is to increase temperature distribution, whereas in the absence of viscous dissipation, the effect of increasing Prandtl number, Pr, is to increase the heat transfer rate, significantly, which are absolutely in accordance with the physical expectation. In addition, the presented work is in contrast to the effects of other parameters that show the same tendency as that already reported in existing literature [15, 16].

Figures 6 and 7 indicate the behavior of parameters on $\eta$. The effects of $Sc$ and $Sr$ on $\eta$ are indicated through Figure 6. In this figure, $\eta$ decreases by increasing $Sc$ and $Sr$. Figure 7(a) illustrates the effect of $M$ on $\eta$. It is clearly observed that $\eta$ increases by increasing $M$. Figure 7(b) represents the influence of $\gamma$ on $\eta$. It is seen that $\eta$ decreases by increasing the value of $\gamma$.

Figures 8 to 11 are plotted to study the effects of heat transfer coefficients $Z_{h_1}$ and $Z_{h_2}$ for different values of $Er$, $Pr$, $\beta$, and $M$. Heat transfer coefficient, $Z$, has oscillatory behavior, which is due to the propagation of peristaltic waves along the walls of the channel. Figures 8 and 9 represent that the absolute value of heat transfer coefficient increases by increasing the values of $Er$ and $Pr$. Figure 10 depicts that the absolute value of heat transfer coefficient decreases at the upper wall, but increases at the lower wall of the channel by increasing $\beta$. Figure 11 indicates that the absolute value of heat transfer coefficient $Z$ decreases when $M$ increases.

7. Conclusion

In this study, the combined effect of slip condition, heat transfer, and chemical reactions on the peristaltic flow of Walter’s B fluid in an inclined asymmetric channel has been investigated. The system of partial differential equations is first written in terms of ordinary differential equations by using adequate similarity transformations and then solved analytically through perturbation method. In particular, analytic solutions have been developed for shear stress $S_{xy}$, temperature $\eta$, concentration $\gamma$, and heat transfer coefficient $Z$. The results are discussed through graphs. The main observations in this study are:

- The absolute value of shear stress, $S_{xy}$, decreases as $M$ increases at the upper and lower walls;
- The temperature $\eta$ decreases with an increase in $\beta$, while with increase in Pr, Sc, and $\gamma$, the temperature $\eta$ increases;
- The absolute value of heat transfer coefficient, $Z$, decreases by increasing $M$ and $\beta$, but the reverse behavior is noted by increasing the values of Pr, Sc, and $\gamma$ at the upper wall of the channel;
- The absolute value of heat transfer coefficient, $Z$, decreases by increasing $M$ at the lower wall, whereas its behavior is quite opposite for increasing values of Pr, Sc, $\beta$, and $\gamma$;
- The concentration $\eta$ increases with the increase of $M$; however, with increase in Sr, Sc, and $\gamma$, the concentration $\eta$ decreases.
Nomenclature

- \( \eta_0 \) : Limiting viscosity at small shear rate
- \( k_0 \) : Short memory coefficient
- \( k \) : Thermal conductivity
- \( \xi \) : Specific heat
- \( \beta \) : Slip parameter
- \( \delta \) : Wave number
- \( \kappa \) : Viscoelastic parameter
- \( p \) : Pressure
- \( I \) : Identity tensor
- \( S \) : Extra-stress tensor
- \( T \) : Fluid temperature
- \( c \) : Concentration
- \( M \) : MHD parameter
- \( T_m \) : Temperature of the medium
- \( D \) : Coefficient of mass diffusivity
- \( K_T \) : Thermal diffusion
- \( \varepsilon \) : Rate of strain tensor
- \( Re \) : Reynolds number
- \( Er \) : Eckert number
- \( Pr \) : Prandtl number
- \( Sc \) : Schmidt number
- \( Sr \) : Soret number

**Biographies**

**Ambreen Afsar Khan** received her PhD degree from the Department of Mathematics, Quaid-i-Azam University, Islamabad, Pakistan. She is an Assistant Professor at International Islamic University, Islamabad, Pakistan. Her several research articles in the field of fluid mechanics have been published in the journals of international repute.

**Hafsa Usman** is working as a Research Scholar under the supervision of Dr. Ambreen Afsar Khan in the Department of Mathematics and Statistics, International Islamic University, Islamabad, Pakistan.

**Kambiz Vafai** is Professor of Mechanical Engineering at University of California, Riverside (UCR), where he started as the Presidential Chair in the Department of Mechanical Engineering. He joined UCR from The Ohio State University, where he received outstanding research awards as Assistant, Associate, and Full Professor. He is a fellow of American Association for Advancement of Science, American Society of Mechanical Engineers, and World Innovation Foundation and an Associate Fellow of the American Institute of Aeronautics and Astronautics. He is in the ISI highly cited category. He has carried out various sponsored research projects through companies, governmental funding agencies, and national labs. He has also consulted in various companies and national labs and has been granted seven US patents. He was the recipient of the ASME Classic Paper Award in 1999 and received the 2006 ASME Heat Transfer Memorial Award. He is also the recipient of the highest award of the International Society of Porous Media. Dr. Vafai received his BS degree from the University of Minnesota Minneapolis, and the MS and PhD degrees from the University of California, Berkeley.

**Rahmat Ellahi** is Professor of Mathematics in the Faculty of Science at Taibah University, Madinah Munawwarah, Kingdom of Saudi Arabia. He is Fulbright Fellow at the University of California, Riverside, USA. He received outstanding awards such as Fulbright Award of USA, Best University Teacher Award from Higher Education Commission of Pakistan, Valued Reviewer from Elsevier, Best Book Award, etc. He is editor of 11 international journals and is on review panels of more than 175 international journals. He has published 135 research articles in journals of international repute. He has supervised 5 PhD students and several research students at MS level. He has carried out 2 sponsored research projects through HEC under NRPU and USEFP funding. He is the author of 6 books. He has been contentiously honored with annual Research Productivity Award based on his excellent
scientific achievements by Ministry of Science and Technology since 2009. Recently, PCST honored him with the 7th topmost Productive Scientist of Pakistan Award “Category A” in the year 2015. He has established international collaboration with 30 prominent scientists of his field. He has the honor of being the Founder Chairman of the Department of Mathematics at International Islamic University Islamabad (IUI).

The Department of Statistics and Physics at IUI has been successfully established due to his humble contribution. In addition, he is founder of Quality Enhancement Cell at IUI. He is actively involved in different academic bodies at national and International levels. His field of research consisting of nanofluid, heat transfer, porous media, peristaltic motion, and blood flow has many industrial applications.
